

INSTALL MANUAL

<u>2003-2007 5.9 Dodge Cummins</u> <u>Positive Air Shutoff</u>

PLEASE READ ALL INSTRUCTIONS BEFORE INSTALLATION

An Information decal has been provided in this kit. This may allow safety personal and inspector's to quickly identify that your vehicle is equipped with a BD Positive Air Shut Down unit. Install this decal in a visible location on the inside glass of the vehicle.

KITCONTENTS:Please check to make sure that you have all the parts listed in this kit before you start the disassembly of your truck.

WELCOME

Thank you for purchasing a BD positive air shutoff. This manual is divided into different areas to assist you with your installation and operation of your positive Air shutoff.

This product is a safety product and should be tested often.

Installation should occur on a vehicle properly secured to prevent rolling.

REQUIRED TOOLS

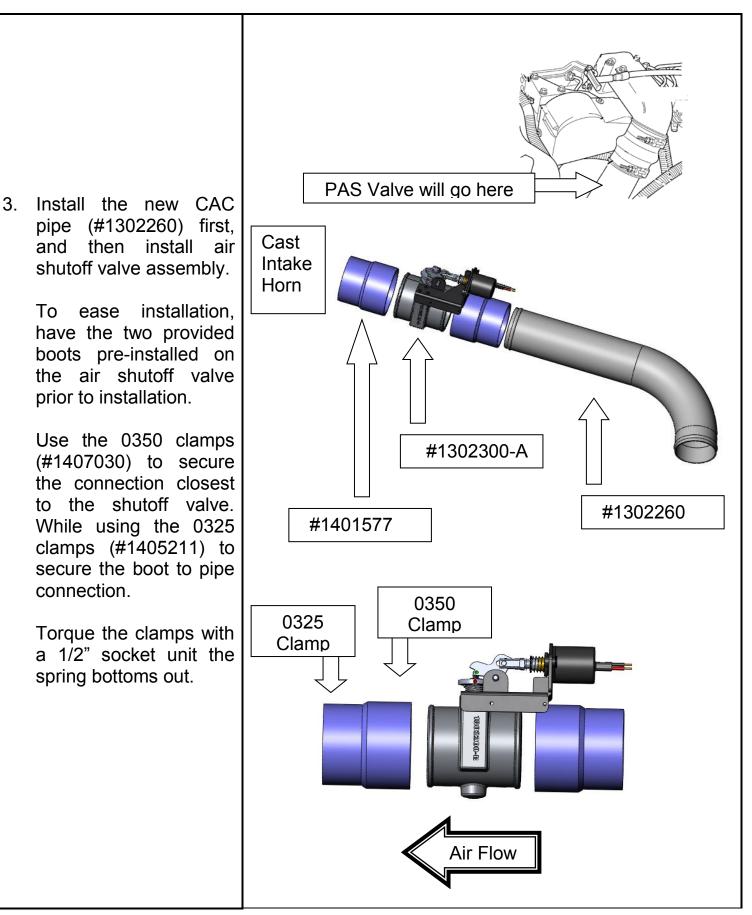

- Frequency/Voltmeter (Optional)
- Drill
- 1/8" Drill Bit
- 1/2" Unibit
- Electrical Tape
- Soldering Iron

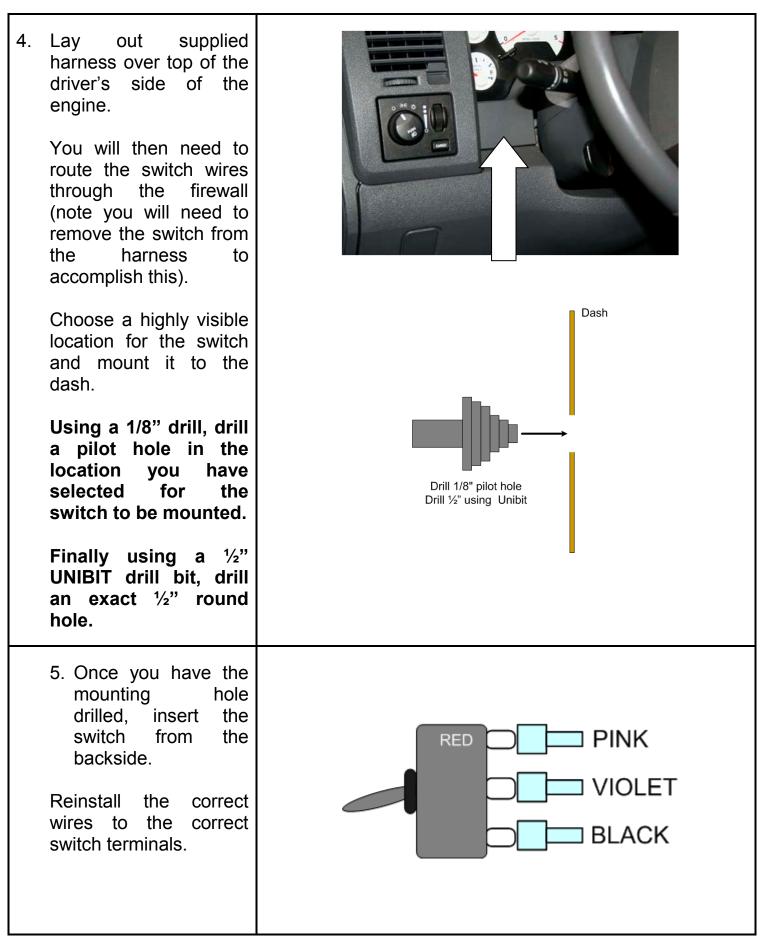

- Air or Manual Ratchet
- 7/16", 1/2" Sockets
- Wire Strippers
- Wire Cutters
- Heat Gun

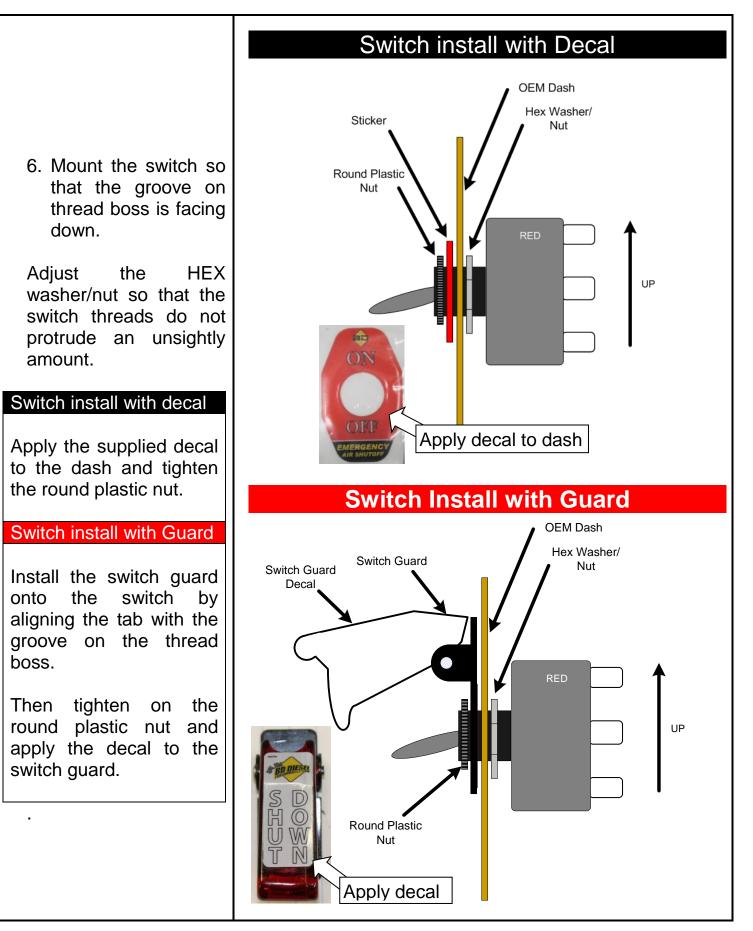

MAINTENANCE

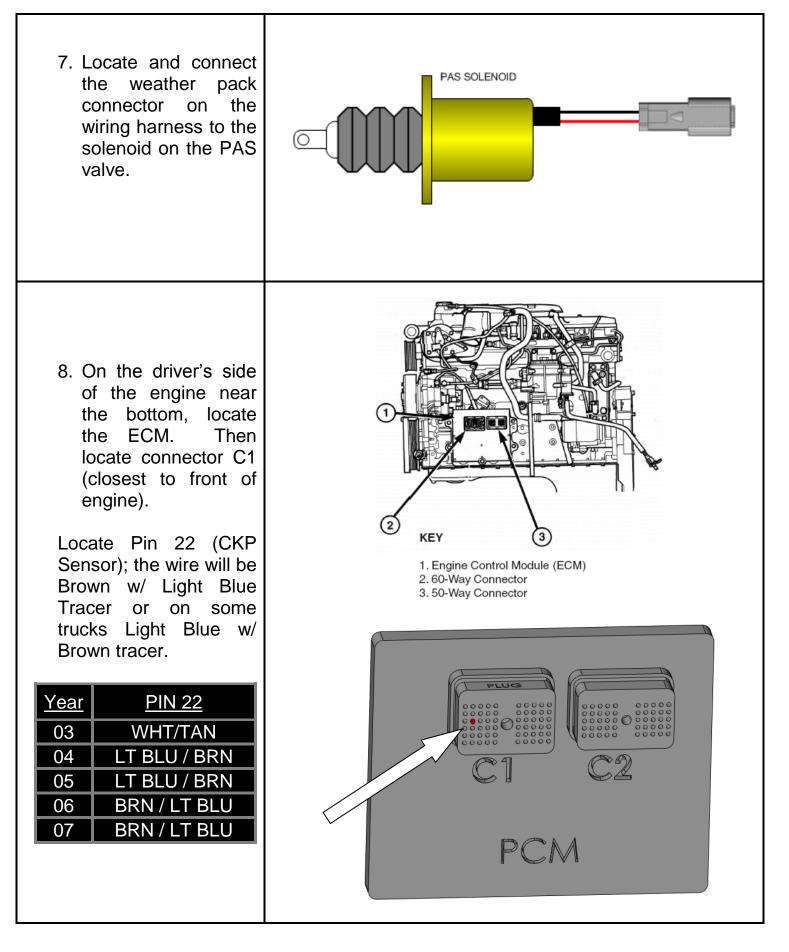

No maintenance is needed other then check to make sure the valve is acting correctly. Please see the testing section later in the manual for the correct procedure.

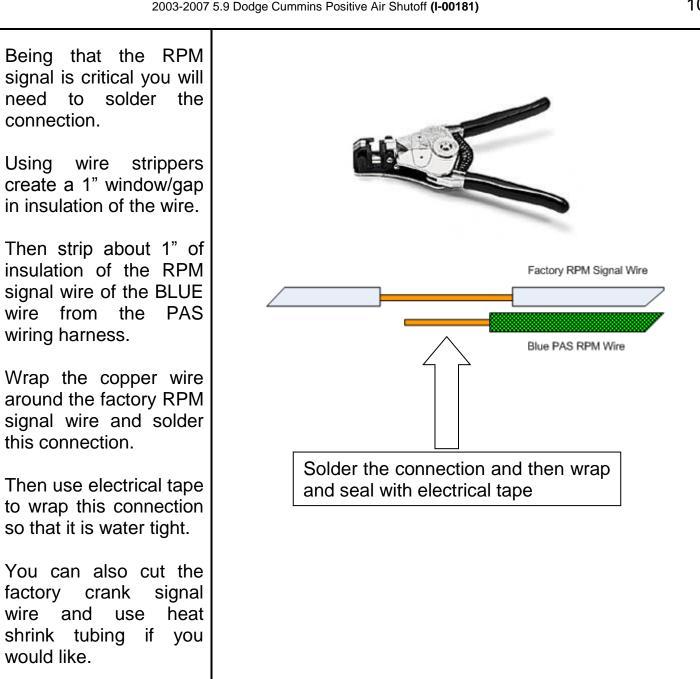

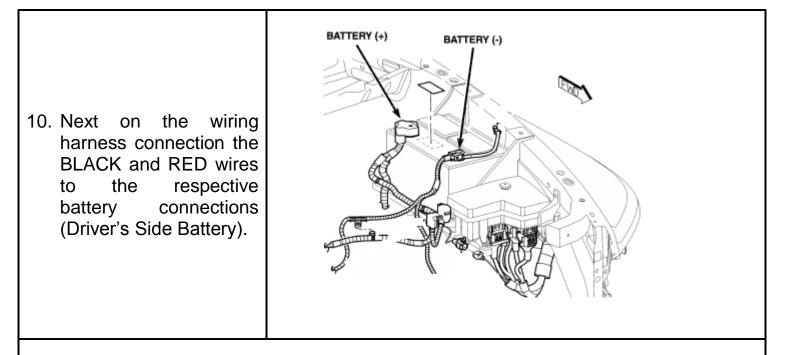

9.

wire

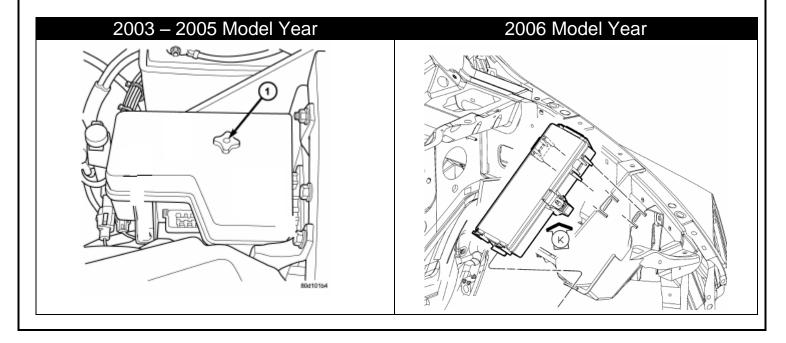

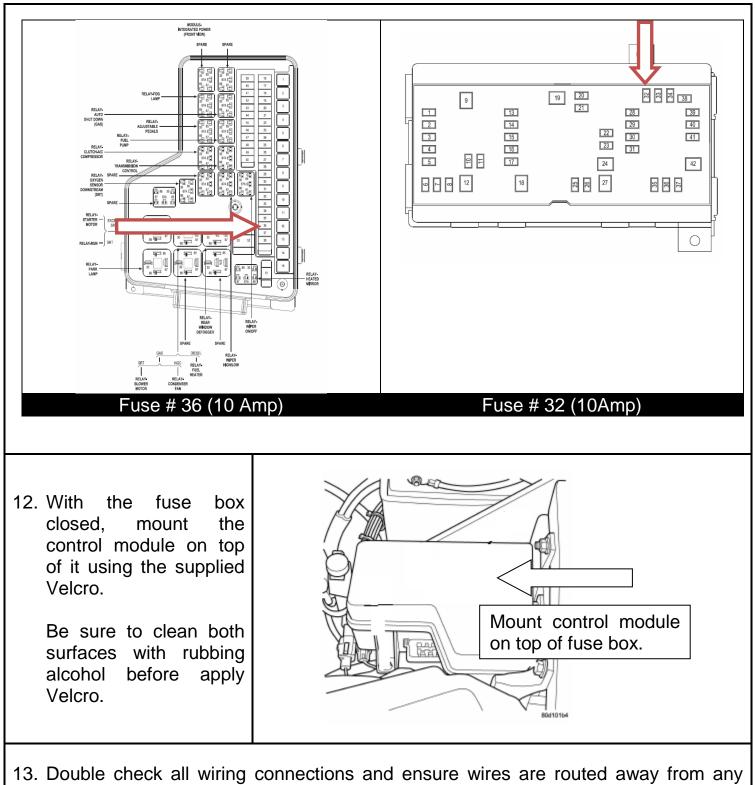

11. For the last connection you will need to locate ignition power. This will power the automatic over speed control box LED switch. Note that they unit can still be activated manually with the switch at any time.

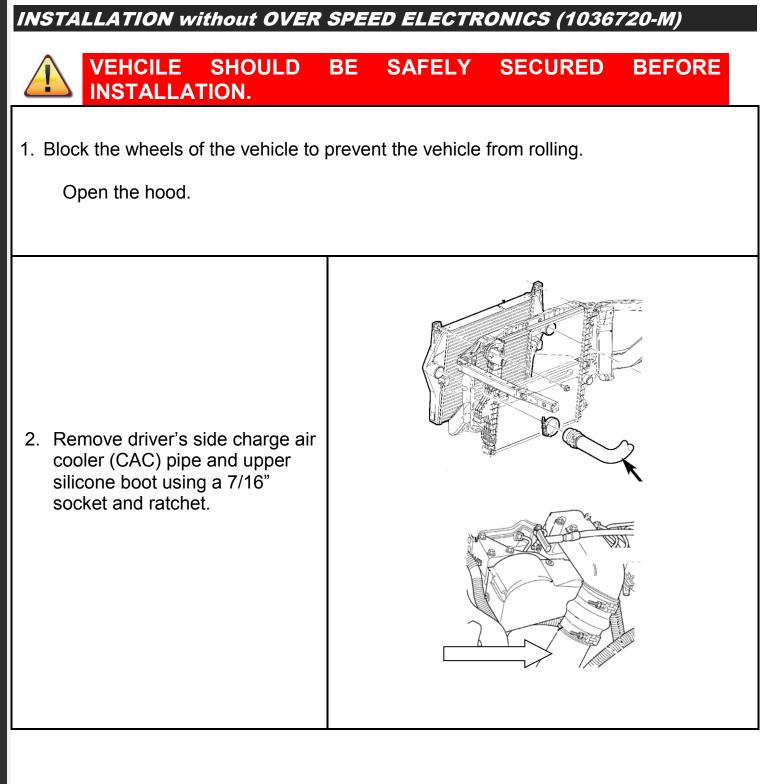

Locate the fuse panel in front of the driver's side battery. Remove the cover.

Locate appropriate fused ignition power circuit (see table below). Install fuse tapper on to fuse, reinstall fuse. Connect yellow lead wire with flag connector to this new connection. Route wire out of fuse box and close lid.

13. Double check all wiring connections and ensure wires are routed away heat sources and moving parts.

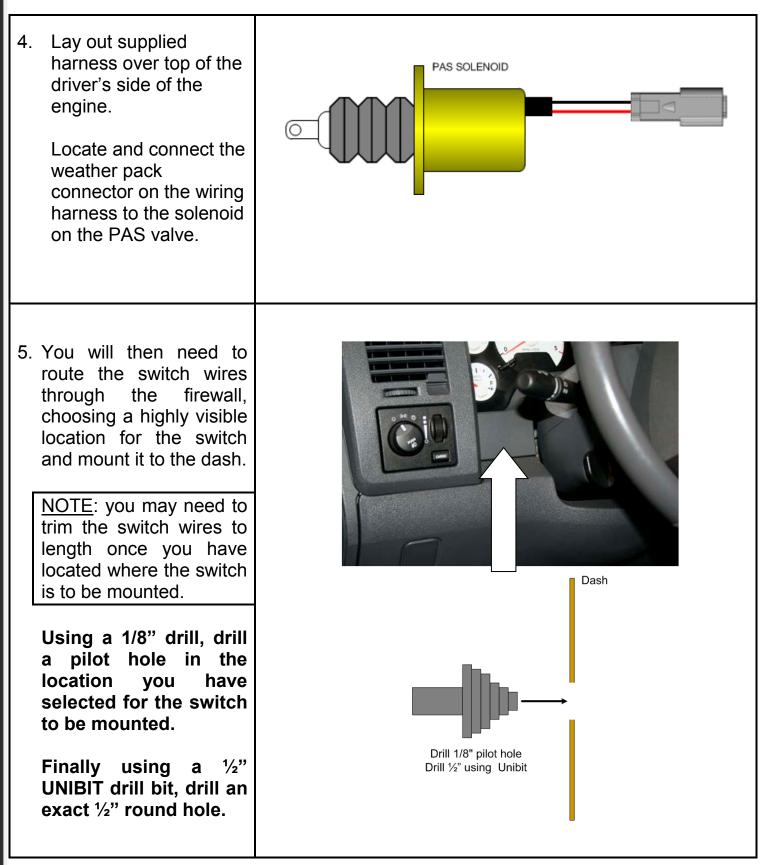

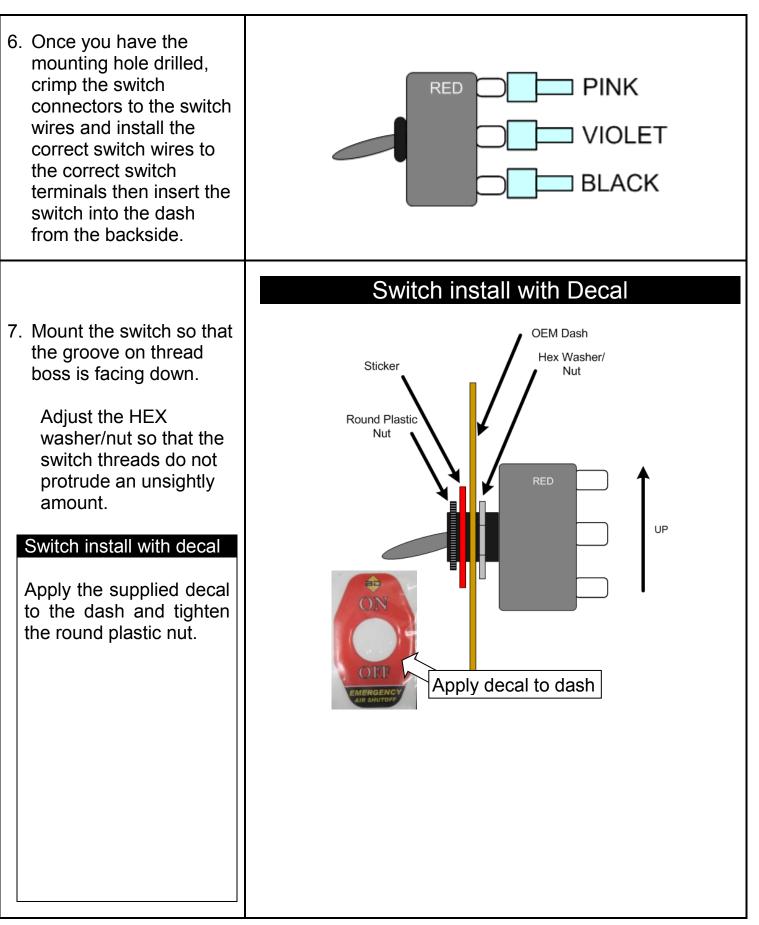

- PAS Valve will go here air Cast Intake Horn #1302300-A #1302260 #1401577 0350 0325 Clamp Clamp Air Flow
- Install the new CAC pipe (#1302260) first, and then install air shutoff valve assembly.

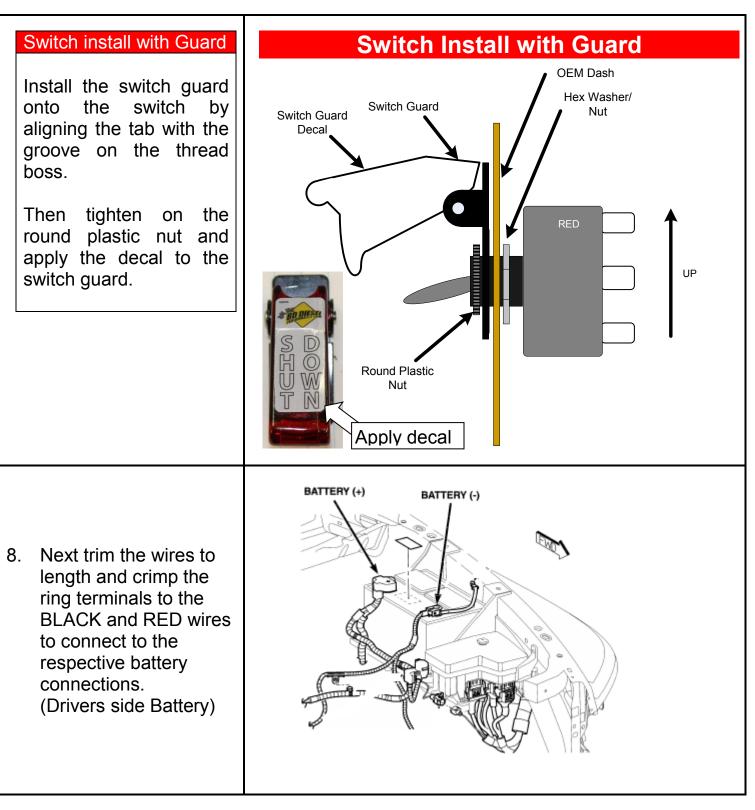

To ease installation, have the two provided boots pre-installed on the air shutoff valve prior to installation.

Use the 0350 clamps (#1407030) to secure the connection closest to the shutoff valve. While using the 0325 clamps (#1405211) to secure the boot to pipe connection.

Torque the clamps with a 1/2" socket unit the spring bottoms out.

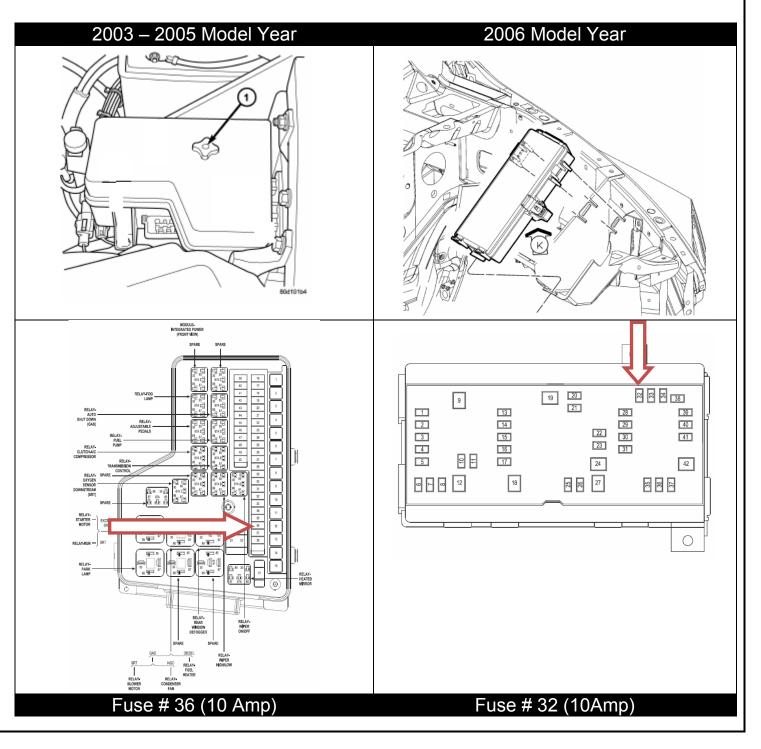

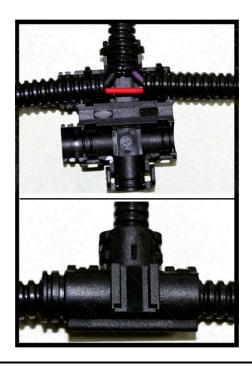

9. For the last connection you will need to locate ignition power.

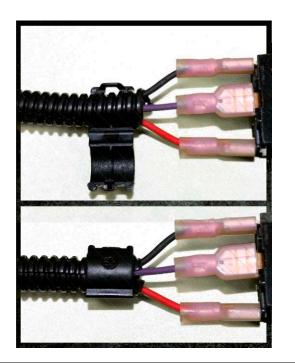

Locate the fuse panel in front of the driver's side battery. Remove the cover.

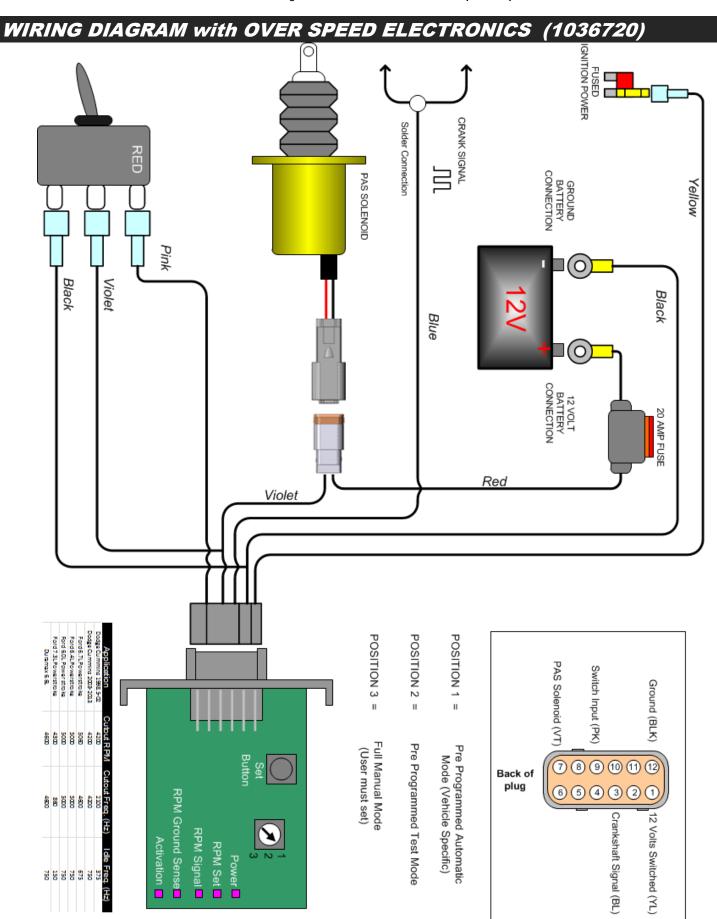

Locate appropriate fused ignition power circuit (see table below). Install fuse tapper on to fuse, reinstall fuse. Trim the pink wire to length and crimp the flag connector to the wire and connect the pink lead wire with flag connector to this new connection. Route wire out of fuse box and close lid.

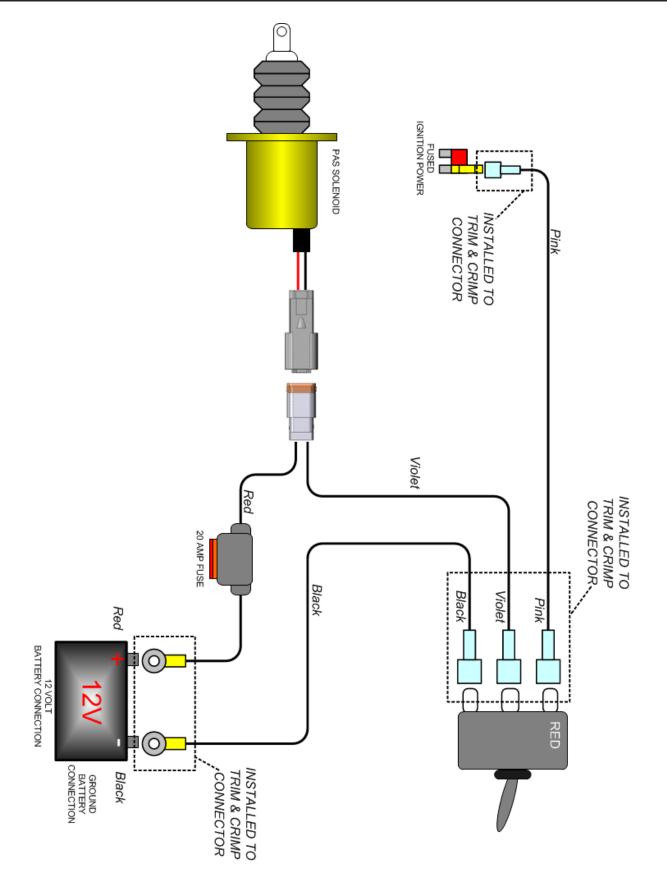

10. Double check all wiring connections and ensure wires are routed away from any heat sources and moving parts. Then install the loom with the supplied tee connector and clips for the loom ends and continue to the testing flow chart without over speed electronics in this manual.

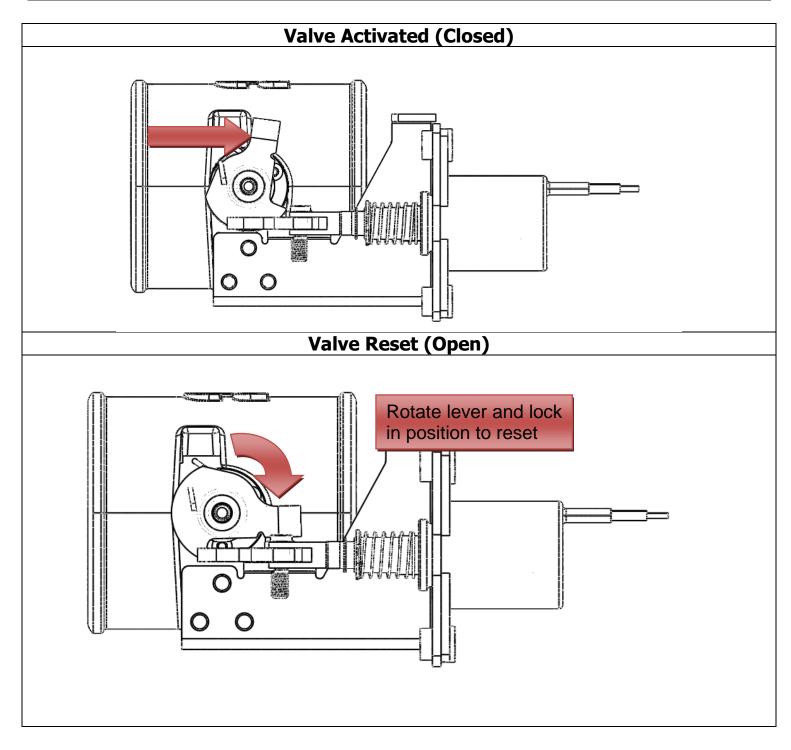

WIRING DIAGRAM without OVER SPEED ELECTRONICS (1036720-M)

RESETTING THE VALVE

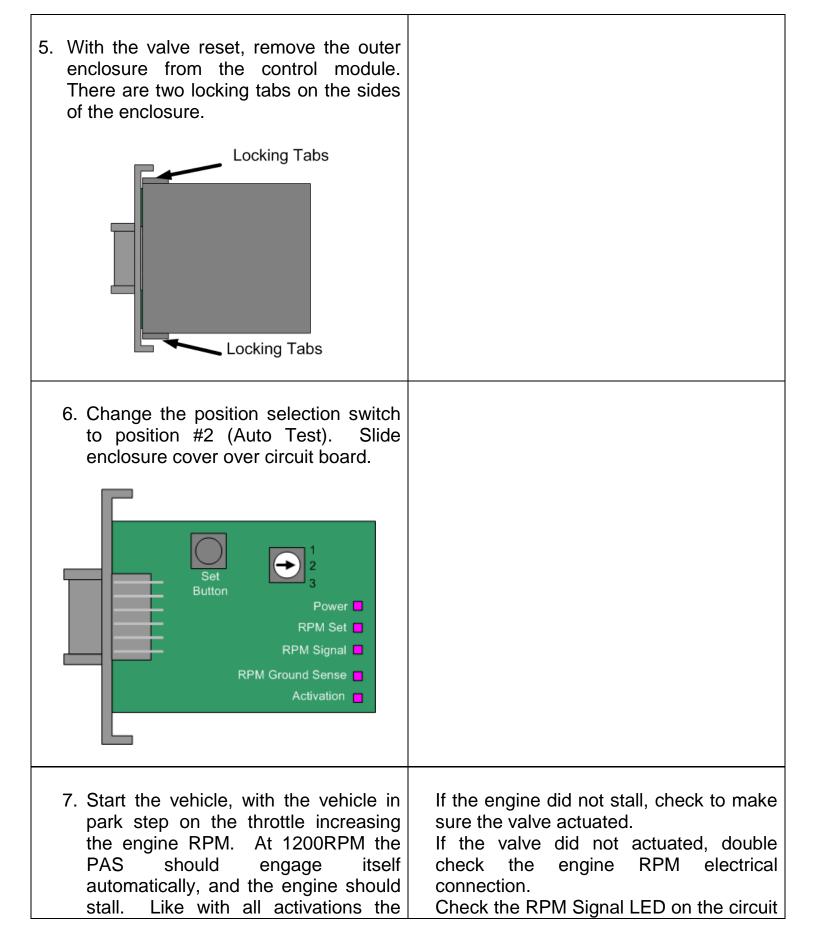

SETUP, TESTING AND VERIFICATION with OVER SPEED ELECTRONICS

Each unit is specifically configured for each model of truck. As in the case of different model years and makes the engine RPM frequency is different.

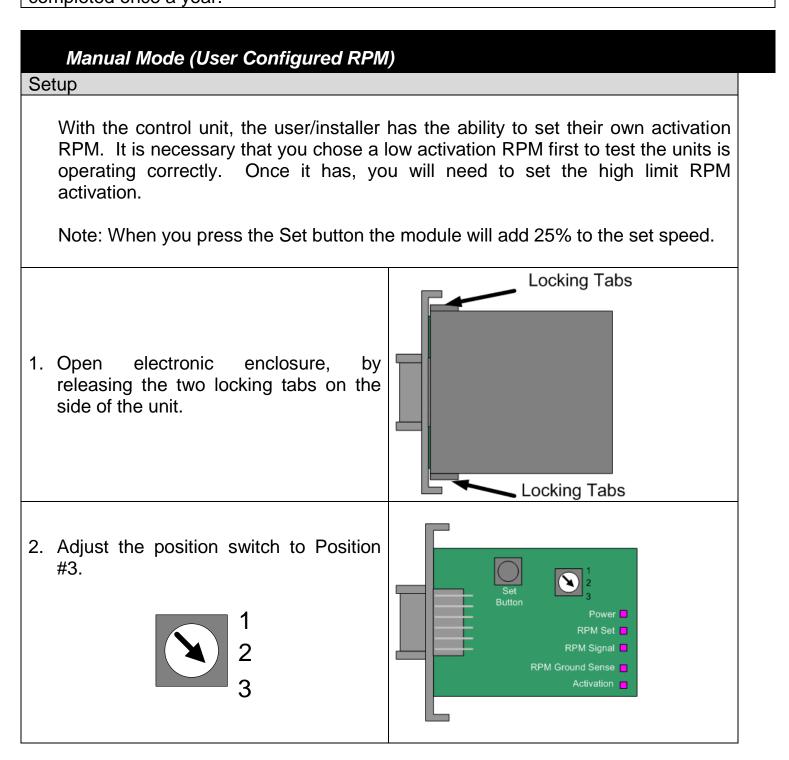

Engine Idle Speed Frequency 03-09 Dodge Cummins 600-800 Hz (1:1) ratio

2003-2009 Dodge Cummins	Activation RPM	Activation Freq. (Hz)
PAS Switch Position #1 (Automatic Mode)	4200	4200
PAS Switch Position #2 (Test Mode)	1200	1200
PAS Switch Position #3 (Manual Mode)	User Configured	User Configured

Aı	Automatic Mode (Pre Configured RPM)			
	Action	Failure/Fix/Notes		
1.	Turn the ignition key to the on position. You should see the RED light illuminate on the toggle switch.	If the LED does not illuminate, check the wiring to the back of the switch first. Then check entire circuit.		
	Next, start the engine. With the engine idling, activate the toggle switch. You should hear the solenoid activate and the valve close. The engine should die. Once the engine dies the switch should flicker ON and OFF indicating a trip condition.	If the engine does not die, check to make sure the valve actuated. If the valve did not actuate check switch and ground wiring. If valve did actuate but the engine is still running, ensure nothing has contacted the valve mechanism		
4.	You can now reset the valve, by rotating the upper lever and engaging the solenoid stop.			

toggle switch should flash.	board, it should flash proportionally to the engine RPM.
8. Reset the valve and reset the mode position switch to position #1	
You are now complete and the unit should for completed once a year.	function correctly. This test cycle should be

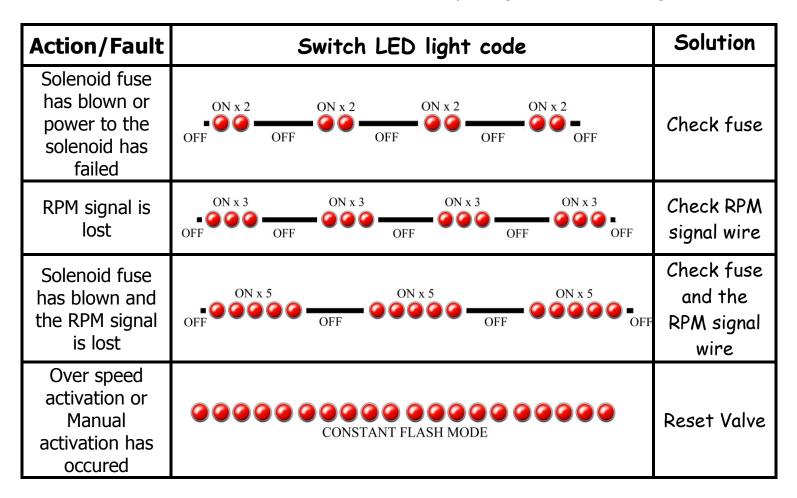

_		
3.	Start the engine.	PRESS & HOLD Set
4.	Press and hold the RPM SET button.	Button
	When you push the SET RPM button will see the "RPM Set" LED illuminate.	RPM Set
5.	With another person helping you, have them step on the accelerator with the vehicle in park. Raise the engine RPM to 1200 RPM.	RELEASE TO STORE RPM
6.	Release the SET RPM button.	RPM Set
	Upon releasing the button the unit will store the RPM + 25%. So for this example the unit has stored 1200RPM + $25\% = 1500$ RPM.	You should see the RPM signal flash proportionally to engine RPM.
7.	Now increase the RPM of the engine to test the activation circuit is working correctly. As in this example the valve should activate at 1500RPM.	You should see the ACTIVATION LED flash ON/OFF on activation. If the valve does not activate check the wiring. If the valve activates but the engine does not stall, ensure nothing has contacted the valve linkage.
8.	With the valve activated the engine should die. Reset the valve and restart the engine.	
9.	Press and hold the RPM SET button. When you push the SET RPM button will see the "RPM Set" LED illuminate.	

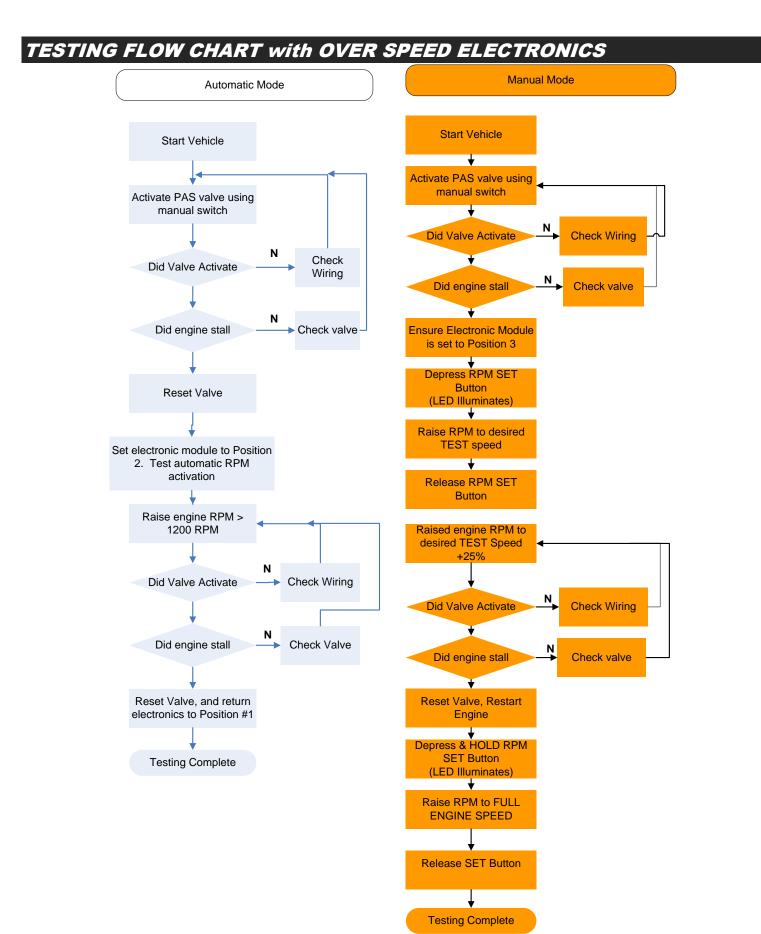

10. With another person helping you, have them step on the accelerator with the vehicle in park. Raise the engine RPM to MAXIMUM engine RPM.11. Release the SET RPM button.	PRESS & HOLD Button RPM Set
Upon releasing the button the unit will store the RPM + 25%. So for this example the unit has stored MAXIMUM engine RPM + 25%.	RELEASE TO STORE RPM
12. You can now put the electronic enclosure back together and secure it the fuse box.	
 13. With the engine running you will need to test to make sure the manual activation switch is functioning correctly. 14. With the engine running, lift the activation switch and the engine should die. 15. Reset the valve and you are now complete. 	If valve does not activate check the wiring. If the valve activates and the engine does not die ensure nothing has contacted the linkage.
	tion, please be sure to complete the test

once a year to make sure the unit is functioning correctly.

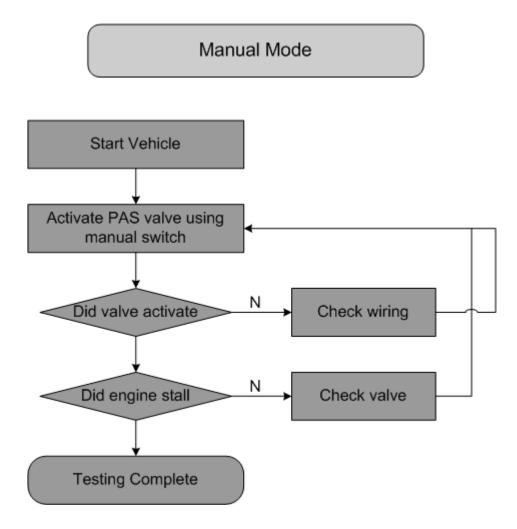

TROUBLE SHOOTING with OVERSPEED ELECTRONICS

After an action/fault has occurred, the LED light located on the Positive Air Shutoff switch will indicate what action or fault has occurred by using the switch LED light code.

TESTING FLOW CHART without OVER SPEED ELECTRONICS

LED OPERATION	Set Button Power RPM Set RPM Signal RPM Ground Sense Activation
	Description
POWER	Illuminates when unit is POWERED
RPM SET	Illuminates when SET Button is Pressed
RPM Signal	Flashes proportional to Engine RPM
Ground Sense	Illuminates when a GROUND signal is sensed on the activation line
Activation	Flashes when a valve activation is command manually (switch) or automatically
Toggle Switch LED	The LED will flash indicating either a problem with the system (Loss of RPM or Power) or an activate valve activation.
