CROSS-LIST P. 342

THE FUNCTION OF AN IGNITION COIL

The coil fundamental function is to transform the battery tension's energy into a high voltage signal able to generate a spark at the spark plug top. Conceived for static ignition applications in severe environment, the

main advantages of the coil are energetic efficiency improvement, weight and obstruction reduction of the ignition function and engine assembly facilitated.

THE INTEGRATED IGNITION WIRE SET

Developed by EFI Automotive. It is suitable for mono or twin static applications. The ignition wire set and coil function are associated in one unit. Of modular design, it insures connection liability and it is suitable for all engines configurations. This solution is the best compromise from the technical and economic point of view when the coil function has to be displaced: hostile environment surrounding plugs, lack of space and/or accessibility.

THE INTEGRATED IGNITION UNIT

Developed and patented by EFI Automotive, is suitable for all engines working with mono or twin static ignition strategy. It can be inserted in the space between the two camshafts for 16 valves engines or fixed vertically for 8 valves engines. All high voltage connections are carried out in one single operation during assembly. It makes reliable high voltage connections and its assembly is carried out in only one operation for the 4 cylinders.

DIRECT IGNITION COIL (D.I.S.)

As a static tension transistor, the DIS is part of the ignition circuit. It is assembled jointly with the ignition wire set to bring high voltage to the spark plugs and create the spark.

PENCIL COIL

This coil is reserved for mono static ignition applications. This coil fits narrow spark plug well of 18 to 24 mm diameter.

Compare to the top plug coil, the «active» part is situated inside the plug.

TOP-PLUG COIL (OR MUSHROOM COIL)

This technic integrates one coil per plug. The «active» part is on the top of the plug (top plug). Beyond its application for automotive, it is also used in the planes engines for safety reasons.

PENCIL OR TOP PLUG IN RACK

This coil combines the advantages of the top plug coil and the integrated coil.

WHY REPLACE A COIL?

A defective ignition coil can result in technical damages

FIRST SYMPTOMS:

- Increased fuel consumption and carbon dioxide emission
- Starting your car is difficult by cold and/or humid weather, the battery runs down
- You detect flat spots in the car's acceleration and power loss
- The engine downs easily

CONSEQUENCES:

- The car does not start anymore
- The spark plugs, the battery can be damaged
- The electronic control unit and on-board electronics could be at risk of permanent damage.

WIRE WOUND CABLE

WIRE WOUND TECHNOLOGY:

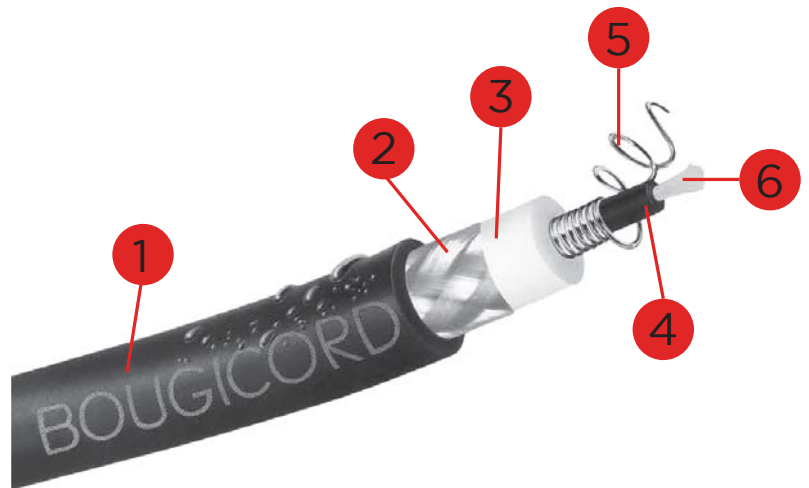

This cable has stainless steel wire wound around a ferromagnetic core. When crossed by an electrical current, a magnetic field appears inside it. Two effects allow the perfect interference suppression :

Inductive effect :

Interferences will face an inductive and resistive impedance which will reduce them.

Resistive effect :

This wire wound cable has a resistance role at a rate of 5600 Ohms/m. This technology is ideal for low frequencies.

| 1 | Outer sheating in a synthetic rubber | 4 | Ferromagnetic compound |
| 2 | Fibre glass braiding | 5 | Stainless steel resistance wire |
| 3 | Insulation in synthetic rubber | 6 | Synthetic string |

COPPER CABLE

COPPER CORE TECHNOLOGY:

These ignition wires have a copper core associated or connected to a punctual resistance, placed in the metal shielding caps fixed next to the spark plugs.

Because of this resistance, electrical current is reflected to the opposite side (like an echo) then sent to the vehicle mass.

This resistance plays the interference suppression role.

IGNITION SYSTEM (SPARK-IGNITION ENGINE)

A classic ignition system is generally composed of a battery, a high tension coil, an ignition distributor, an ignition wire set and spark plugs.

IGNITION DISTRIBUTOR

An ignition distributor drives the high current produced by the coil toward the spark plugs, in the correct ignition order. On most vehicles equipped with this system, the distributor is composed of a distributor cap, a condenser, a rotor arm and a contact breaker.

DISTRIBUTOR CAP

The distributor cap ensures the high tension sequential distribution according to the number of distribution points determined by the engine number of cylinders.

CONDENSER

A condenser is an electric or electronic component essential, made of two conductive armatures (called "electrodes") in total influence and separated by a polarized insulator.

The condenser is a kind of energy tank which fills and empties. Moreover, it avoids arc formation between the two contact points while they spread (misfire) by collecting at this exact moment the electrical charge.

ROTOR ARM

The rotor is placed under the ignition cap and on its axle. It distributes the high tension current from the coil to the spark plugs, in the ignition order planned in the distribution scheme (generally 1-3-4-2 for a 4 cyl. engine). This current comes through a cam follower (or coal) positioned in the centre of the distributor cap, directly connected to the coil by one the wire of the ignition wire set, and it delivers it to the concerned spark plug by getting in touch with one of the four (in the case of a 4 cyl engine) or six (for a six cyl) connectors placed under the distributor cap.

IGNITION CONTACT BREAKER (OR CONTACT SET)

The ignition contact breaker is made of two elements : a fixed element equipped with a contact point, and a moving breaker lever also equipped with a contact point (made of tungstone). The contact breaker is like a switch on the ignition circuit : when the contact points move apart (this exact moment is called the break), the coil receives the information that it has to deliver high tension current to the ignition cap. When the contact points are "in contact", the coil knows that it has to stopped to emit. How do the contact breakers move apart? Simply under the action of the ignition axle actionned by the camshaft.
