

Classic Dash 16-Pulse GPS Receiver

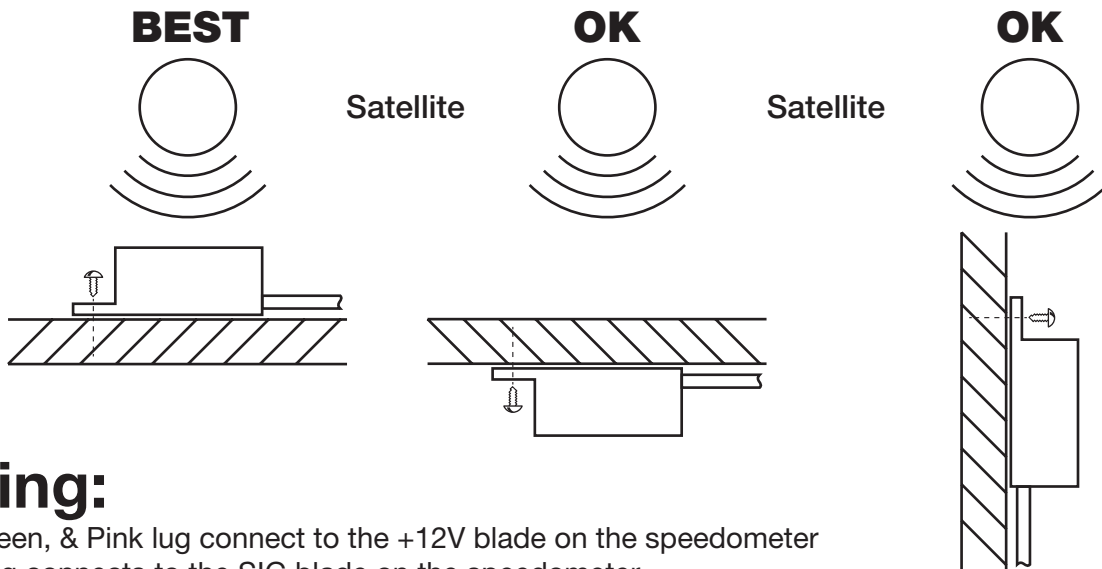

Part number 69248

About:

Designed to work in conjunction with Auto Meter and other GPS speedometers, the Classic Dash 16-Pulse GPS receiver transmits tracking signals to the speedometer. If the satellite signal should be lost due to obstruction from tall buildings, tunnels and overpasses, the receiver will recapture the signal and the speedometer will maintain the correct speed and mileage readings.

Installation:

For best results the receiver should be mounted in a position to obtain the most direct satellite signal; on top of the dashboard being preferred. However, the unit can be installed under the dash or other locations. It is important to make sure there is sufficient signal strength before permanently mounting the receiver. It can take up to 3 minutes from the time the power is turned on for initial satellite recognition.

Wiring:

Red, Green, & Pink lug connect to the +12V blade on the speedometer
White lug connects to the SIG blade on the speedometer
Black lug connects to the GND blade on the speedometer
Pink male connector connects to the pink female connector for speedometer
Black male connector connects to the black female connector for speedometer
