

# OPERATOR'S MANUAL Model #10448

22TON HIGH VERSION AIR SERVICE JACK

# Main data of 22Ton High Version Air Service Jack

LIFTING CAPACITY	MIN. HEIGHT	MAX. HEIGHT	N.W.	G.W.	PACKAGE SI <b>Z</b> E	AIR PRESSURE
22 Ton	8.27"	20.67"	101.41 lbs	110.23 lbs	2.6 x 1.42 x 1.1"	101.5-145 psi

#### OWNER/OPERATOR RESPONSIBILITY

It is the owner/operator responsibility to properly use and maintain this equipment and the legibility of all warnings and instruction labels. Carefully read and understand the instructions and warnings in this manual before operating this equipment. Keep this manual in a safe location for future reference.

#### FAILURE TO HEED THESE WARNINGS MAY RESULT IN PROPERTY DAMAGE AND OR PERSONAL INJURY.

-Use as lifting device only.

-Use only on hard, level surface.

- -Support load by appropriate means after lifting
- -Do not exceed rated capacity.
- -Center load on the lack
- -Do not modify jack. -Only use attachments and/or adapters supplied with or sold specifically for the jack.
- -Only lift areas of the vehicle designated by the vehicle manufacturer.

#### INSPECTION

Prior to each use, visually inspect for leaking hydraulic oil, damaged, loose or missing parts. If jack is worn or damaged remove from service and contact your nearest service center for repair.

### **OPERATION**

- 1. Tightly close the release valve knob (located on top of the "T" handle) by turning it clockwise.
- 2. Center the load on the jack saddle. Connect the air supply, and squeeze the air valve lever to raise the load. Release the air valve lever to stop movement.
- 3. Transfer the load to support stands.
- 4. To lower the jack, open the release valve knob by SLOWLY turning it counterclockwise.

NOTE: To adjust the handle, pull up and then release the lever to lock it in one of three positions.

## **Bleeding The Jack**

Air bubbles can become trapped inside the hydraulic system, reducing the efficiency of the jack. Purge air from the system as needed by following these steps:

- 1. With the jack sitting on its base and the ram retracted, bleed air by opening the release valve.
- 2. Pump for 10 seconds.

## **Pump Prime Instructions**

The air/hydraulic pump may lose its prime during shipment or after long periods without use. To prime the pump, follow these steps:

- 1. Remove the upper cover.
- 2. Loosen the hex socket bolt one-half turn. See Figure 1.
- 3. Close the release valve.
- 4. Operate the air pump while repeatedly tightening and loosening
- 5. When the piston begins to rise, tighten the bolt. Verify that the piston can rise to the maximum height position.

Figure 1

#### MAINTENANCE

Check oil level. With the jack in an upright position and the ram completely retracted, open the release valve (turn coun ter-clockwise) and remove the filler plug. The oil level should be just up to the hole. Fill if necessary with clean hydraulic

Lubricate internal components. With the release valve open, manually pump the handle six times.

Keep the jack clean. Occasionally lubricate the handle socket pivot point, extension screw, release screw thread, and air valve to prevent corrosion.

# **TROUBLE SHOOTING**

Problem	Cause	Solution	
Erratic Action	Air in system     Viscosity of oil too high     Ram sticking or binding      Internal leakage in ram	With jack sitting on its base and ram retracted, bleed air by opening release valve. Pump for 10 seconds.     Change to a lower viscosity oil.     Look for dirt, gummy deposits, leaks, misalignment, worn parts, or defective packing.     Replace worn packings. Look for excessive contamination or wear.	
Ram does not advance	Release valve is open     Low/no oil in reservoir     Air locked system      Load is above capacity of system     Pump lost its prime	<ol> <li>Close release valve located on top of "T" handle.</li> <li>Fill with oil &amp; bleed system.</li> <li>With jack sitting on its base and ram retracted, bleed air by opening release valve, running pump for 10 seconds.</li> <li>Use correct equipment.</li> <li>Follow "Pump Prime Instructions".</li> </ol>	
Ram only extends partially	Low oil level in reservoir     Piston rod is binding	Fill reservoir with oil, & bleed system.     Look for dirt, gummy deposits, leaks, misalignment, worn parts, or defective packing.	
Ram advances slowly	Low air pressure     Pump not working correctly     Leaking seals	Adjust air pressure to 90–145 psi.     Rework pump.     Replace seals.	
Ram advances but doesn't hold pressure	Release valve is open     Ram seals are leaking     Pump check valve not working     Overload valve leaking or not adjusted	1. Close release valve located on top of "T" handle. 2. Replace seals. 3. Clean / replace check valve. 4. Replace / adjust overload valve.	
Jack leaks oil	Worn or damaged seals	Replace seals.	
Ram will not retract, or retracts slowly	Release valve is closed     Reservoir too full     Ram damaged internally	Open release valve.     Drain oil to correct level.     Take jack to authorized service center for repair.
