

## Product Questions

### **With the expedition kit installed, can you still mount a roof top tent?**

On racks 1255mm wide and under, you will have to remove sections of rail on both sides for the tent to clear the side profile. On racks 1345mm wide and over, you will have to remove at least a section on the side that the tent opens to. Because of the increased difficulty of putting the cover on and zipping it up, we do not typically recommend expedition rails around the tent.

### **Will this fit my 3rd pajero?**

Yes, it will. Please be sure you have a Front Runner Slimline II Pajero 3rd Gen Roof Rack (KRMP001T) as our products are designed to work with Front Runner Related products only.

### **Will this fit my Jeep Wrangler rack ?**

You'll actually want to use SKU KRXJ002 for the proper fitting Expedition Rails.

### **Will this fit on the Tacoma (2006 double cab) rack?**

Yes! This absolutely fits the 2005-current Tacoma Double Cab Rack (SKU KRTT002T).

### **What is the weight load that this rack can handle?**

This is actually not a rack we offer but an addition to the rack system. It is a side rail which acts as a bumper or basket for your cargo. While our side rail is not rated for weight bearing, it is fairly ridged and is made of stainless steel and die cast aluminium. We suggest if you are using it as a strapping point, secure closest to the joiners as they are the strongest point. Our rack, on the other hand, is rated to carry a load up to 660 lbs.
