

LUBER FINER[®]

BUILT TO DO MORE[®]

MEDIUM AND HEAVY-DUTY 2018 APPLICATION CATALOG

BUILT TO DO MORE®

LUBE FILTERS

Oil is the lifeblood of the heavy duty engine. Luber-finer® high-efficiency oil filters provide protection from oil contaminants to help ensure optimal performance. Efficient filtration can reduce wear, guard against system failure and promote maximum equipment performance and uptime.

FUEL FILTERS

Diesel fuel quality can have a major impact on engine operation and performance. Fleets must meet emissions standards while trying to maintain efficiency and maximize uptime. A quality Luber-finer® Fuel Filter can remove fuel contaminants, microbes and excess water. Scheduled maintenance and use of Luber-finer® Fuel Filters are vital to protecting your fuel system and equipment investment.

t

CABIN FILTERS

Fleet managers and regulators are always trying to improve safety. Breathing cleaner cabin air may help drivers be more alert so they can finish their routes safely. Quality cabin air filters can help remove allergens, dust and particulate matter that can irritate the eyes, nose and throat.

Subject

Heavy Duty Filters.....	Inside Front Cover
Table of Contents.....	1-3
Spanish Footnotes	4-15
French Footnotes	16-27
Product Identification.....	28
Heavy Duty Filters.....	Inside Back Cover

HOW TO USE THIS CATALOG TO SELECT THE CORRECT LUBER-FINER PRODUCT –

USE INDEX BARS **1** through **4** if you know
the vehicle, equipment or engine model.

Table of Contents

- On-Highway Applications.....1-166
- Radial Seal Air Filter Design 167-169
- Loss of Oil Pump Prime..... 170

Section 1

- Off-Highway Applications 1-534

Section 2

- Lawn and Garden Equipment 1-51
- The Impact of Dents on Canister Filters..... 52

Section 3

- Engine Applications..... 1-92
- Luber-finer Warranty93-96

Section 4

Radial Seal Air Filter Design

For many years, air filters shared a common design philosophy. Whether for automotive or heavy duty applications, cartridge air filter elements sealed by compressing sealing gaskets on one or both ends of the filter element. This filter element design relied on “axial” loading to establish proper seal compression and maintain alignment within the housing. Squeezing a marshmallow between the palms of your hands would duplicate the type of force applied to an axial sealing air filter within its housing. Radial sealing air filters are typically designed with one (1) open end cap and one (1) closed end cap. The seal in the air filter housing (mounting tube) is created on the inside diameter (ID) of the open end cap for the primary element or the outside diameter (OD) of the secondary (inner) air filter element. A primary element seals against the outside of the mounting tube while a secondary element (if present) seals against the inside of the mounting tube. This “radial” sealing mechanism duplicates the type of forces created when a plastic lid is stretched onto a coffee can (outer element) or a stopper is placed in a bottle (secondary element). By the nature of their design, radial sealing elements are self centering and self aligning. Radial sealing air filter systems offer several advantages, but because of their unique design, they also have some special service tips and procedures, which should be followed.

Standard replacement “axial” sealing air filter elements and “radial” sealing air filter elements are designed to fit and function very differently. “Radial” sealing elements **cannot** be used in conjunction with conventional “axial” sealing elements.

1. Radial sealing elements **cannot** be fitted into a housing unless it is equipped with the proper mounting tube.
2. Care should be taken when mixing different brands of radial sealing elements as there may be design differences between manufacturers, which may not make all elements interchangeable.
3. The cover of the air cleaner housing must be reinstalled after the filter element is serviced. The cover plays no part in sealing the element to the housing, but does prevent the element from moving from its mounting tube.
4. Do not use the cover to force the air filter element onto the mounting tube. The elements should be fully inserted onto the tube before the housing cover replaced.
5. Follow manufacturers special instructions if there are any for the application of a lubricant for the element seal.

REMOVAL AND INSTALLATION INSTRUCTIONS FOR RADIAL SEAL AIR FILTERS

Removal:

1. Remove housing lid.
2. Grasp used filter with two hands.
3. Unseat and pull filter from housing with a twisting motion.

Installation:

1. Install inner filter first (if equipped) then outer. Apply firm pressure using a rocking motion on the outer rim of each filter until it seats in the housing.
2. Install the housing cover and tighten cover bolts.

Diseño de Filtros de Aire con Sello Radial

Durante muchos años, los filtros de aire compartieron una filosofía de diseño común. Ya sea para aplicaciones automotrices o de uso industrial. Los electos del cartucho de filtro de aire sellado mediante juntas de sellado de compresión en uno o dos de los extremos del elemento de filtrado. Este diseño de elemento de filtrado se basó en cargas “axiales” para establecer una compresión de sello apropiada y mantener alineamiento dentro de la carcasa. El apretar un malvavisco entre las palmas de sus manos duplicaría el tipo de fuerza aplicada a un filtro de aire con sello axial dentro de su carcasa. Los filtros de aire con sello radial están típicamente diseñados con una (1) tapa de extremo cerrada. El sello en la carcasa del filtro de aire (tubo para montaje) es creado en el diámetro interno (DI) de la tapa de extremo abierta para el elemento primario o el diámetro externo (DE) del elemento (interno) secundario del filtro de aire. Un elemento primario sella en contra del exterior del tubo para montaje mientras un elemento secundario (de estar presente) sella contra el interior del tubo para montaje. Este mecanismo de sellado “radial” duplica el tipo de fuerzas creadas cuando una tapa de plástico se extiende en una lata de café (elemento externo) o un tapón se coloca en una botella (elemento secundario). Por la naturaleza de su diseño, los elementos del sello radial se centran y alinean por sí mismos. Los sistemas de filtros de aire con sello radial ofrecen muchas ventajas, pero debido a su diseño único, también tienen algunos pronósticos y procedimientos que deben ser seguidos.

Los elementos estándar de reemplazo de filtros de aire con sello “axial” y elementos de filtros de aire con sello “radial” están diseñados para adecuarse y funcionar de maneras distintas. Los elementos de sellos “radiales” **no pueden** ser utilizados en conjunto con elementos de sellos “axiales” convencionales.

1. Los elementos de sello radial **no pueden** ser adecuados a una carcasa a menos que se encuentre equipada con el tubo para montaje adecuado.
2. Debe tenerse cuidado cuando se mezclen distintas marcas de elementos de sellado radial externos e internos ya que puede haber diferencias de diseños ente fabricantes que pueden causar que no todos los elementos sean intercambiables.
3. La cubierta de la carcasa del filtro de aire debe ser reinstalada después de que darle servicio al elemento de filtrado. La cubierta no tiene ninguna función en el sellado del elemento en la carcasa, pero previene que el elemento se mueva de su tubo para montaje.
4. No utilice la cubierta para forzar el elemento del filtro de aire en un tubo para montaje. El elemento debe estar completamente insertado en el tubo antes de que se reemplace la cubierta.
5. Siga las instrucciones especiales del fabricante de haberlas para la aplicación de un lubricante para sello del elemento.

INSTRUCCIONES DE DESMONTAJE E INSTALACIÓN PARA FILTROS DE AIRE DE SELLO RADIAL

Desmontaje:

1. Desmonte la tapa de la caja.
2. Sujete el filtro usado con ambas manos.
3. Libere y retire el filtro de la caja mediante un movimiento de torsión.

Instalación:

1. Instale primero el filtro interno (si lo tuviera) y luego el externo. Aplique una presión firme utilizando un movimiento basculante en el borde externo de cada filtro hasta que pueda insertarse en el interior de la caja.
2. Instale la cubierta de la caja y apriete los pernos de la misma.

Filtre À Air À Joint Radial

Depuis de nombreuses années la conception des filtres à air fait intervenir des principes de conception communs. Qu'il s'agisse d'un filtre à air pour automobile ou équipement "service rigoureux", la cartouche de filtration est constituée d'un élément scellé entre deux joints comprimés aux extrémités. Dans ce cas l'étanchéité adéquate est obtenue grâce à un chargement axial qui comprime les joints et maintient l'alignement de l'élément de filtration dans le logement du filtre à air. Ce qui se passe est similaire à ce qu'on observe si on comprime une guimauve entre les paumes des mains. Un nouveau type de filtre à air a été élaboré durant les dernières années; il est maintenant utilisé sur de plus en plus d'automobiles et d'équipements pour service rigoureux. À la différence des modèles antérieurs, le nouveau système met en oeuvre un scellement radial des éléments de filtration sur un tube de montage fixé à demeure dans le logement du filtre à air. Un filtre à air à scellement radial comporte un embout ouvert et un embout fermé. Le scellement dans le logement du filtre à air (tube de montage) est réalisé sur le diamètre interne de l'embout ouvert de l'élément primaire, ou le diamètre externe de l'élément de filtration secondaire (interne). L'élément primaire est scellé contre la face externe du tube de montage, tandis que l'élément secondaire (s'il y en a un) assure l'étanchéité contre la face interne du tube de montage. Les forces mises en jeu dans ce mécanisme de scellement radial sont similaires à celles qui sont créées lorsqu'on étire un couvercle de plastique pour le placer sur une tasse à café (élément externe), ou lorsqu'on place un bouchon dans une bouteille (élément secondaire). De par sa nature, un élément à scellement radial est auto-centré et auto-aligné. Un filtre à air à scellement radial offre plusieurs avantages, mais du fait de sa conception particulière on doit respecter certaines procédures d'entretien spéciales.

Les éléments de filtration de remplacement à scellement axial (standard) et à scellement radial sont conçus différemment, et leur fonctionnement est très différent. On **ne doit jamais** utiliser indifféremment des éléments de filtration à scellement radial et éléments conventionnels à scellement axial.

1. Un élément de filtration à scellement radial **ne peut** être installé dans un logement de filtre qui n'est pas doté du tube de montage approprié.sws
2. On doit être prudent si on souhaite utiliser indifféremment divers types d'éléments de filtration à scellement radial, car il peut y avoir des différences de conception d'un fabricant à un autre - qui font que tous les éléments ne sont pas interchangeables.
3. On doit réinstaller le couvercle du logement de filtre après le remplacement de l'élément de filtration. Le couvercle ne joue aucun rôle dans l'étanchéité au contact de l'élément de filtration, mais il empêche l'élément de se déplacer et de se séparer du tube de montage.
4. Ne pas utiliser les crochets du couvercle du logement de filtre pour forcer l'élément de filtration à s'enfiler sur le tube de montage. Il faut que l'élément de filtration soit complètement inséré sur le tube avant la mise en place du couvercle du logement de filtre.
5. Appliquer les instructions spéciales du fabricant (s'il y en a) pour l'application d'un lubrifiant sur le joint. Généralement, si c'est nécessaire pour l'installation, on utilise un lubrifiant sec comme du talc ou un lubrifiant aux silicones.

INSTRUCTIONS POUR LA DÉPOSE ET L'INSTALLATION DES FILTRES À AIR À JOINT RADIAL

Dépose :

1. Déposer le couvercle du boîtier.
2. Saisir le filtre usagé des deux mains.
3. Débloquer et retirer le filtre du boîtier en le faisant tourner.

Installation :

1. Installer le filtre intérieur en premier (le cas échéant) puis le filtre extérieur. Appuyer fermement en exerçant un mouvement en va-et-vient sur le rebord extérieur de chaque filtre jusqu'à ce qu'il soit bien assis dans le boîtier.
2. Installer le couvercle du boîtier et serrer les boulons du couvercle.

Loss of Oil Pump Prime

Immediately after an oil change one of the most confusing issues to face the typical do-it-yourselfer or professional mechanic is failure to get oil pressure back into the operating range.

Although not a common occurrence, it is very possible that the oil pump may lose its prime during the oil change.

When the used motor oil is drained from the engine the oil may also drain from the oil pump pickup tube and possibly from the oil pump itself. When new motor oil is installed the pump's pickup tube inlet again becomes submerged trapping air in the tube on the suction side of the oil pump. The trapped air will cause cavitation of the pump and prevent it from producing oil flow and subsequent oil pressure.

Many installers tend to blame this on the oil filter and assume that the filter is blocking the flow of oil. Since the filter is now suspect the installer will install a second filter. Sometimes this solves the problem because the trapped air was released when the first filter was removed. Of course, the installer's suspicion that the oil filter was at fault has increased.

The point being made is the oil filter was not the problem and in most cases there is a simple solution.

If after the oil and filter change, the red light or low oil pressure remains for ten seconds, shut the engine off, remove the oil filter and, using an oil squirt can with 30 weight motor oil, squirt oil several times into the oil filter base outlet on the engine. (This will be the opening beside the threaded stud; it will not do any good to squirt oil into the threaded stud.) Next, fill the filter with new motor oil and reinstall. Start the engine and check for oil pressure. In most cases the problem will be solved. DO NOT allow the engine to run for more than ten seconds without oil pressure. Use a watch to time the ten seconds and be sure of the elapsed time. In some instances the full ten seconds is needed for the pump to recover oil flow. If this fails, again remove the filter and crank the engine until oil spills from the engine base.

DO NOT crank the oil level and restart the engine. Oil pressure should now be back to normal.

Note: Sometimes this problem can be avoided by limiting the time the oil is drained.

Perdida de empuje de la bomba de aceite

Uno de los hechos más confusos que debe enfrentar todo aficionado a la mecánica o mecánico profesional, es la dificultad para conseguir que la presión de aceite vuelva a sus valores normales de operación inmediatamente después de un cambio de aceite.

Aunque esto no es muy común, es posible que la bomba de aceite pierda su empuje durante el cambio de aceite.

Cuando se drena el aceite usado del motor, puede también drenarse aceite del tubo de recolección de la bomba de aceite, y posiblemente de la bomba de aceite misma. Cuando se instala el nuevo aceite de motor, la entrada del tubo de recolección de la bomba queda nuevamente sumergida, quedando así aire atrapado en el tubo en el lado de succión de la bomba de aceite. El aire atrapado causará cavitación en la bomba, e impedirá que la misma produzca la circulación, y la presión, de aceite.

Muchos instaladores tienden a culpar de esto al filtro de aceite, suponiendo que es el filtro el que bloquea la circulación de aceite. Dado que ahora el filtro está bajo sospecha, el instalador colocará un segundo filtro. En algunas ocasiones esto resuelve el problema, debido a que el aire atrapado fue liberado al quitar el primer filtro. Por supuesto, la sospecha del instalador de que el filtro de aceite tenía una falla parece confirmarse.

Es importante tener en cuenta que el filtro de aceite no era el problema, y que en la mayoría de los casos hay una solución simple.

Si luego del cambio de aceite y filtro la luz roja de baja presión de aceite permanece encendida por diez segundos, apague el motor, quite el filtro de aceite y, usando una jeringa de aceite cargada con aceite de motor grado 30, haga chorrear aceite varias veces dentro del orificio de salida de la base del filtro de aceite, situado en el motor. (Debe ser en la abertura que está junto al perno roscado; no es conveniente echar aceite en la rosca misma). Luego, llene el filtro con nuevo aceite de motor, y reinstálelo. Arranque el motor y verifique la presión de aceite. En la mayoría de los casos el problema habrá quedado resuelto. NO permita que el motor funcione por más de diez segundos sin presión de aceite. Use un cronómetro para controlar los diez segundos, asegurándose exactamente del tiempo transcurrido. En algunos casos se necesitan los diez segundos completos para que la bomba haga reanudar la circulación de aceite. Si esto fallara, quite nuevamente el filtro y arranque el motor hasta que el aceite se derrame de la base del motor. NO haga durar esta maniobra más de diez segundos por vez. Cuando el aceite se haya derramado, reinstale el filtro de aceite, corrija el nivel de aceite y vuelva a arrancar el motor. La presión de aceite debe haber vuelto ahora a su valor normal.

Nota: A veces puede evitarse este problema limitando el tiempo de drenaje del aceite.

Perte d'amorçage de pompe à huile

Immédiatement après un remplacement d'huile, un des problèmes les plus troublants à affronter pour le mécanicien bricoleur ou professionnel est l'impossibilité de ramener la pression d'huile dans sa plage normale de fonctionnement.

Bien que cela ne soit pas systématique, il est fort possible que la pompe à huile se désamorçe pendant la vidange de l'huile.

Quand l'huile moteur usagée est vidangée du moteur, il se peut qu'elle se vidange aussi du tube plongeur de la pompe à huile, et éventuellement de la pompe elle-même. Quand une nouvelle huile moteur est versée, le tube plongeur devient submergé et de l'air est emprisonné dans le tube du côté de l'aspiration de la pompe à huile. Cet air prisonnier va créer une cavitation dans la pompe et l'empêcher de débiter l'huile, d'où une montée en pression insuffisante.

Beaucoup d'installateurs ont tendance à blâmer pour cela le filtre à huile, en pensant que c'est lui qui bloque le débit d'huile. Comme le filtre est suspecté, l'installateur va le remplacer par un second filtre. Parfois cela solutionne le problème parce que cela peut relâcher de l'air prisonnier en démontant le premier filtre. Et bien sûr la suspicion de l'installateur que le problème venait du filtre s'en trouve renforcée.

Ce qu'il faut bien retenir est que le filtre à huile n'est généralement pas la cause du problème et qu'il y a une solution simple pour l'éliminer.

Si après un remplacement d'huile et de filtre, le voyant rouge de pression d'huile basse reste allumé dix secondes après le démarrage moteur, coupez-le, enlevez le filtre à huile, et en utilisant une burette avec de l'huile moteur indice 30, envoyez plusieurs fois de l'huile dans l'orifice de base de filtre à huile du moteur (visez l'ouverture à côté du goujon fileté, il ne sert à rien de mettre de l'huile dans le goujon). Ensuite, remplissez le filtre avec de l'huile moteur et remettez-le en place. Démarrez le moteur et surveillez la pression d'huile. Dans la plupart des cas, le problème aura été solutionné. NE LAISSEZ PAS le moteur tourner plus de dix secondes avec une pression d'huile insuffisante. Utilisez votre montre pour chronométrer avec certitude le temps écoulé après le démarrage. Dans certains cas, il faut ce délai au complet pour que la pompe reprenne son débit normal. Si cela a échoué, enlevez de nouveau le filtre et lancez le moteur jusqu'à ce que de l'huile coule de sa base. NE faites PAS tourner le moteur plus de dix secondes à la fois. Quand l'huile se déverse, remettez le filtre, refaites le niveau d'huile et redémarrez le moteur. La pression d'huile doit être redevenue normale.

Remarque : Parfois, le problème peut être évité en limitant le temps de vidange de l'huile.

The Impact of Dents on Canister Filters

Filter manufacturers often receive used filters involved in warranty investigations due to a crack in a filter canister. In many cases the crack is located within or near a dent in the canister. This evidence predominantly indicates that the dent caused the crack and that the failure was not within the control of the filter manufacturer. Once the steel canister is dented, a concentration of stress in the canister material is created, making the canister more susceptible to fatigue.

The fatigue to the material results from the pressure pulses within the system. The pressure is regulated by a pressure regulating valve. This valve is spring operated and intermittently opens and closes to regulate the pressure. Once the pressure exceeds the setting of the spring in the regulating valve, the valve will open and relieve pressure until the spring can expand and close the valve. This function is repeated continuously during the operation of the system, creating a pulsing effect. The canister of the filters is subjected to the same pulsation. However, unlike the spring in the pressure regulating valve, the canister material is susceptible to failure after such fatigue.

Filters are designed with a low carbon steel to resist fatigue and are formed so the stress created by the pulses in the system are equalized over the surface area of the canister. A dent provides an area of stress concentration from pressure pulses and can greatly shorten the fatigue life of the canister.

Filters that are dented prior to or during installation should not be used. Filters dented after installation should be replaced immediately. The cost of replacing a dented filter is much less than the cost of the damages that could result from a dented filter that fails during service. If you receive filters that were dented prior to your receipt, you should contact your filter supplier for corrective action.

La importancia de las abolladuras en los filtros

Los fabricantes de filtros a menudo reciben filtros usados que están en proceso de investigación por garantía debido a rajaduras en el bote. En muchos casos la rajadura está localizada cerca o en una abolladura en el bote. Esta evidencia predominantemente indica que la abolladura causó la rajadura y que la falla no está dentro del control del fabricante del filtro. Una vez que la lámina del bote sufre una abolladura se crea una concentración de esfuerzos en el bote, haciendo al bote más susceptible a la fatiga.

La fatiga del material del bote es el resultado de los pulsos de presión dentro del sistema. La presión está controlada mediante una válvula reguladora de presión. Esta válvula está operada por un resorte e intermitentemente abre y cierra para regular la presión. Una vez que la presión excede el ajuste del resorte en la válvula reguladora, la válvula abrirá y aliviará la presión hasta que el resorte pueda regresar y cerrar la válvula. Esta función se repite continuamente durante la operación del sistema creando un efecto de pulsación. El bote del filtro está sujeto a la misma pulsación. Sin embargo, a diferencia del resorte de la válvula reguladora de presión, el material del bote está expuesto a fallar debido a dicha fatiga.

Los filtros están fabricados con lámina de acero de bajo contenido de carbono para resistir la fatiga y están diseñados de tal manera que el esfuerzo creado por los pulsos de presión se distribuya uniformemente en toda la superficie del bote. Una abolladura provoca un área de concentración de esfuerzos y puede acortar significativamente la vida a la fatiga del bote.

Los filtros abollados antes y durante la instalación no deben ser usados. Los filtros abollados después de la instalación deben ser reemplazados inmediatamente. El costo del reemplazo de un filtro abollado es mucho menor que el costo de los daños que pudieran resultar por un filtro abollado que falle cuando esté en servicio. Si a usted le entregan filtros que están abollados, antes de recibirlos usted debe contactar a su proveedor de filtros para pedirle una acción correctiva.

Les conséquences d'enfoncements sur les filtres à cartouche

Les fabricants de filtres reçoivent souvent des filtres usagés qu'ils doivent évaluer dans le cadre de leur garantie en raison d'une fissure dans la cartouche du filtre. Dans de nombreux cas, la fissure se trouve au niveau ou à proximité d'un enfoncement dans la cartouche. Cet état de fait indique généralement que l'enfoncement est à l'origine de la fissure et que la défaillance ne relève pas du contrôle du fabricant du filtre. Un enfoncement dans la cartouche en acier crée une concentration de contraintes dans le matériau de la cartouche, ce qui rend la cartouche plus sensible à la fatigue.

La fatigue du matériau est causée par des pulsations de la pression au sein du système. La pression est régulée par un régulateur. Ce régulateur, actionné par un ressort, s'ouvre et se ferme par intermittence pour réguler la pression. Lorsque la pression dépasse le réglage du ressort dans le régulateur, celui-ci s'ouvre pour réduire la pression. La baisse de pression détend le ressort qui referme alors le régulateur. Cette alternance se répète en continu pendant le fonctionnement du système, créant ainsi un effet de pulsations. La cartouche du filtre est soumise à ces mêmes pulsations. Cependant, contrairement au ressort du régulateur, le matériau de la cartouche est susceptible de défaillances en raison d'un phénomène de fatigue.

Les filtres sont fabriqués avec un acier à faible teneur en carbone pour résister à la fatigue et ils sont formés de sorte que les contraintes créées par les pulsations dans le système soient distribuées uniformément sur la surface entière de la cartouche. L'apparition d'un enfoncement produit une zone de concentration des contraintes dues aux pulsations et peut raccourcir considérablement la durée de vie en fatigue de la cartouche.

Les filtres qui sont bosselés avant ou pendant leur installation ne doivent pas être utilisés. Les filtres bosselés après leur installation doivent être remplacés immédiatement. Le coût de remplacement d'un filtre bosselé est bien inférieur au coût des dommages susceptibles de survenir en cas de défaillance d'un filtre bosselé durant le fonctionnement. En cas de réception de filtres déjà bosselés, contacter votre fournisseur de filtres pour qu'il prenne des mesures correctives.

BUILT TO DO MORE®

AIR FILTERS

Heavy duty engines rely on a mixture of air and diesel to generate power. Luber-finer® air filters capture harmful particles that can damage expensive engines. Cleaner air can help increase engine efficiency and lead to greater fleet uptime.

HYDRAULIC FILTERS

Modern hydraulic systems need clean fluid to operate safely and effectively. Efficient filtration reduces wear, guards against system failure and promotes maximum equipment performance and uptime. Minimize contaminants and protect your investment with reliable Luber-finer® filtration.

COOLANT FILTERS

An improperly maintained cooling system can result in costly repairs and downtime. Luber-finer® coolant filters and system solutions help protect your investment. Luber-finer® coolant system products can help reduce fleet costs, downtime and prolong the life of your equipment.
