

LUMEN ERROR FREE

Replacing factory halogen bulbs with some brands of LEDs can cause "bulb out" error messages, sporadic operation, and generate system faults that activate check engine **lights**. Because all bulbs in most modern vehicles are controlled by a single module that is in series with other control computers, something as simple as an improperly designed bulb can break the normal loop of data communication that tells your main engine controller all systems are go. Lumen bulbs are CAN Bus compatible, and have been designed with a higher level of advanced technology that allows proper data flow - so they'll work right every time without error messages, and without confusing any computer controls.
