

PLEASE READ BEFORE STARTING INSTALLATION

While MBRP has made every effort to ensure that all components of this system are of superior quality and properly packaged, it is the installer's responsibility to ensure the following before removal of the factory exhaust:

- that ALL components shown above are present.
- that ALL mating components fit together.

15

16

17

3/8" X 1" HEX BOLT

3/8" FLAT WASHER

3/8" HEX NUT

- that there are no damaged components.
- that the system you have purchased is appropriate for your vehicle year, model and configuration.
- that the system will not interfere with any modifications previously installed or planned.
- that you have read and understand these instructions.

Removal of Stock System

- **1.** Apply penetrating lubricant liberally to all exhaust fasteners, hangers, and rubber isolators.
- **2.** Remove the heat shield at the front of the vehicle. It is helpful to remove the rear fasteners from the plastic under tray to allow better access to the front pipe fasteners.

Refer to Figure 1.

- **3.** Un-bolt the rear of the OEM cat-back from the front pipe. **Refer to Figure 2.**
- **4.** Remove the clips holding the bumper liner at the rear of the car on both sides so it may be folded down to make room for the outside exhaust hangers to drop down. **Refer to Figure 3.**
- **5.** Disconnect all rubber isolators and remove the rear of the factory exhaust. It is recommended to have a support under the exhaust or a second person to assist in this step.
- **6.** Un-bolt the front pipe from the down pipe. Remove the rubber isolator from the hanger on the vehicle. Pull the front pipe back from the down pipe, then remove the front pipe towards the front of the vehicle. The rear flange is a tight fit but can be removed with some rotation and gentle pulling without damaging the heat shielding.

Refer to Figures 4 and 5.

Retain all rubber isolators as they will be reused.

Installation of MBRP Performance Exhaust

1. Install the new 3.0" **Lower Downpipe** over the steering rack and into the factory rubber isolator. Secure the flange to the downpipe using the OEM hardware and the supplied **Gasket**.

Refer to Figure 6.

2. Install the OEM dual rubber isolator onto the Front Pipe hangers and slide it all the way to the inlet side of the hangers. Using a 3" Band Clamp, install the Front Pipe onto the Lower Downpipe. Slide the dual rubber isolator onto the factory chassis hanger.

Refer to Figures 7 and 8.

- 3. Install the Extension Pipe and Mid Pipe using 3" Band Clamps
- **4.** Install the rear **Driver-side Hanger Assembly** and **Passenger-side Hanger Assembly** (dual hangers) into the outermost OEM rubber isolators at the rear of the vehicle. Re-install the bumper liners. Rotate the brackets downward to leave room for the **Muffler Assembly** to be installed.

Figure 8

Figure 9

Figure 10

- 5. Install the Front Driver-side Hanger Assembly and Front Passenger-side Hanger Assembly (single hanger) onto the Muffler Assembly using the supplied hardware.
 - Refer to Figure 9.
- 6. Install the Muffler Assembly into the factory rubber isolators below the cross member with the previously assembled Front Driver-side Hanger Assembly and Front Passenger-side Hanger Assembly. Secure it to the Mid Pipe with the 3" Swivel Clamp.
- Attach the Muffler Assembly to the Driver-side Hanger Assembly and Passenger-side Hanger Assembly using the supplied hardware. Leave the Hardware loose enough for adjustment.
 Refer to Figure 10.
- 8. Install the Exhaust Tips onto the outlets of the Muffler Assembly and adjust to your preference utilizing the 3" Swivel Clamp joint and the slotted holes in the Driver-side Hanger Assembly and Passenger-side Hanger Assembly.
- **9.**Tighten all hardware and clamps, starting at the front and working rearward to secure the system. Check along the full length of the exhaust system to ensure there is adequate clearance for fuel lines, vent lines, brake lines, frame, bodywork, suspension, and any wiring, etc. If there is any interference detected, relocate, or adjust to provide adequate clearance. Ensure all clamp connections are secure and components are unable to rotate or slide. Band clamps require approximately 45 lb-ft (60 N-m) of torque. Verify clearances, system security and band clamp torque after 30-60 miles (50-100 km) of driving.

Congratulations! You are ready to begin experiencing the improved power, sound and driving experience of your MBRP Performance Exhaust. We know you will enjoy your purchase!
