WATER OUTLET RESTRICTOR KIT

Fits: All Chevy V8, V6 and Small Block Ford V8 Engines

Kit Contains: (3) Restrictor Plates with 5/8", 3/4", and 1" openings.

These Restrictors are used in place of the thermostat to reduce the speed of water flowing through the engine block for more efficient cooling. Restricting the flow of water leaving the block lets you control the amount of heat that's absorbed into the water.

Because radiators and water pump pulleys are sized differently for each engine, you will need to experiment with each Restrictor Plate to determine the amount of flow reduction needed. To obtain the desired cooling system temperature, the Restrictor Plates are packaged with 5/8", 3/4", and 1" openings. One should suit your particular application.
