

Powerful MidBass Driver

MTX Road Thunder Extreme speakers are designed to provide maximum levels of SPL for people that really want to be heard.

The RTX128 is a 12" driver designed to specifically produce mid bass frequencies. This type of speaker is ideal for use in installations that include subs producing high amounts of low frequency bass. The midbass driver fills in the sound frequencies that the subwoofer does not, while not over burdening the high frequency drivers in the system by having them play lower frequencies they are not designed to produce.

The RTX128 features a highly efficient paper cone and large magnet attached to a stamped steel basket. The 300W RMS power handling ensures they will sound great with any amplifier power.

Compliment Heavy Bass High output midrange and high frequency deliver full range sound in systems with multiple subwoofers.	Perfect for Any Music Wide frequency response is perfect for any music. Hear all the detail the artist intended.	Fully Configurable Single 8Ω voice coils allow for multiple speakers to be used on each channel.	High SPL at Any Power High efficiency means high output with any amplifier.
