### RADIATOR COOLING SYSTEM TESTER

This unit and or the accessories are for testing automotive pressure caps and pressurized cooling systems. Never open a cooling system when hot.

Always wear safety shield and protective clothing. Stay clear of moving engine components. The pressure tester is equipped with a pressure gauge which shows readings in pounds per square inch. After fitting the adapter to the radiator or to the cap, pump the pressure until it reaches the pressure number supplied by the manufacturer of the component. Check for leaks on all the fittings that are connected to the cooling system and repair as needed. If the radiator cap test fails replace cap with the manufacturers product that is designed for the vehicle. When refilling the cooling system refer to the manufacturers specifications for the proper mix.

Caution: Always wear safety glasses
