

NOTICE

Grounding: This module is electrically grounded through the case. Therefore both the module case and the vehicle body must be stripped down to bare or plated metal around the mounting holes and the mounting bolts drawn up tightly to ensure a good ground. If problems are encountered, check the case grounding before suspecting the module itself.

5-pin vs. 4-pin: All Replacement modules for Chrysler applications have 4-pin connectors. Early O.E. modules had 5 pins while current Chrysler production also has 4 pins. The New 4-pin modules are correct replacements for both O.E. types (except Dodge Trucks with heavy duty emissions cycle carburetor with electronically controlled vacuum kicker).
