

ASSEMBLY INSTRUCTIONS
FOR
DYNALITE DRAG RACE FRONT BRAKE KIT
WITH 10.75" DIAMETER SOLID ROTOR

1973 - 1980 CDP "A", "B", "E" and "F" BODY • DISC SPINDLE
PART NUMBER GROUP
140-2719-B

**DISC BRAKES SHOULD ONLY BE INSTALLED BY SOMEONE
EXPERIENCED AND COMPETENT IN THE INSTALLATION AND
MAINTENANCE OF DISC BRAKES
READ ALL WARNINGS**

Photographic Tip

Important and highly recommended: Take photos of brake system before disassembly and during the disassembly process. In the event, trouble-shooting photos can be life savers. Many vehicles have undocumented variations, photos will make it much simpler for Wilwood to assist you if you have a problem.

General Information

General Information

*Installation of this kit should **ONLY** be performed by persons experienced in the installation and proper operation of disc brake systems.* Before assembling the Wilwood front disc brake kit, double check the following items to ensure a trouble-free installation.

- Make sure this is the correct kit to match the exact make and model year of the vehicles spindle (i.e., hubs for a 1975 Chrysler-Dodge-Plymouth (CDP) spindle will not fit a 1962 spindle).
- Verify the hub stud pattern in this kit matches the stud pattern of the vehicles wheels.
- Verify your wheel clearance using Figure 3.
- CDP hubs have a 5 x 4.50" and 5 x 4.00" pattern. The 5 x 4.00" pattern does not guarantee fitment with all 5 x 4.00" wheels, either OEM or aftermarket. It is important that wheel center hole clearance be 3.130 or larger to clear hub snout in the kit.
- Inspect the package contents against the parts list to ensure that all components and hardware are included.
- **WARNING:** *The wheel contact surfaces must seat completely on the face of the hub.* If any contact surfaces overhang the outside diameter of the hub face, a 6.60" diameter x .20" thick steel spacer (Wilwood P/N 300-11961, sold separately) **MUST** be used between the wheel and the hub.
- To prevent damage to the hub face, a 6.15" diameter x .09" thick hub shield (Wilwood P/N 300-10716, sold separately) should be used with any *stamped steel wheels* that do NOT overhang the outside diameter of the hub face.
- Always tighten lug nuts to the wheel manufacturer's specifications.

Assembly Instructions (Continued), and Disassembly Instructions

- Always recheck the lug nuts after test driving the vehicle at safe speeds. If they are NOT still tight, inspect the wheel-to-hub contact surfaces for damage and/or incomplete contact.
- As routine maintenance, periodically remove the wheels and inspect the wheel-to-hub contact surfaces for damage.
- It is the installer's responsibility to ensure that the wheels used with this hub kit are properly and securely installed. Some wheels may NOT be compatible with the hub in this kit.

Disassembly Instructions

- Disassemble the original equipment front brakes:
 - Raise the front wheels off the ground and support the front suspension according to the vehicle manufacturer's instructions.

Remove the center cap, cotter pin, nut lock and the wheel bearing nut and washer. Save the wheel bearing nut and nut lock. Remove the brake drum and hub assembly, including the wheel bearings. Disconnect the brake hoses from the brake line at the body. Remove the two upper backing plate retaining nuts and bolts. Remove the two lower ball joint to spindle nuts and bolts. The backing plate, spindle and ball joint will now separate. Remove the brake backing plate and shoes as an assembly. Reinstall the front ball joint bolt and nut. Do not tighten at this time. Do not reinstall the rear bolt and nut.

- Clean and de-grease the spindles. Remove all nicks or burrs on the spindle snout and threads. Remove any of the backing plate gasket which may remain on the spindles. Remove any scale or rust from the gasket area.

Steering Arm / Spindle Modifications

These modifications should be performed by a qualified machinist. Refer to Figure 1 as necessary (numbers in parenthesis refer to the parts list on page four). Only one view of the steering arm/spindle is shown, but the modifications need to be performed on both steering arm/spindles.

Modification Procedure

The three stock holes that will be used to mount the caliper mounting bracket (1) to the steering arm/spindle need to be modified. Drill a .332 diameter hole through all three holes, then tap 3/8-24 UNF (fine thread). Countersink the holes to .438 x 90°.

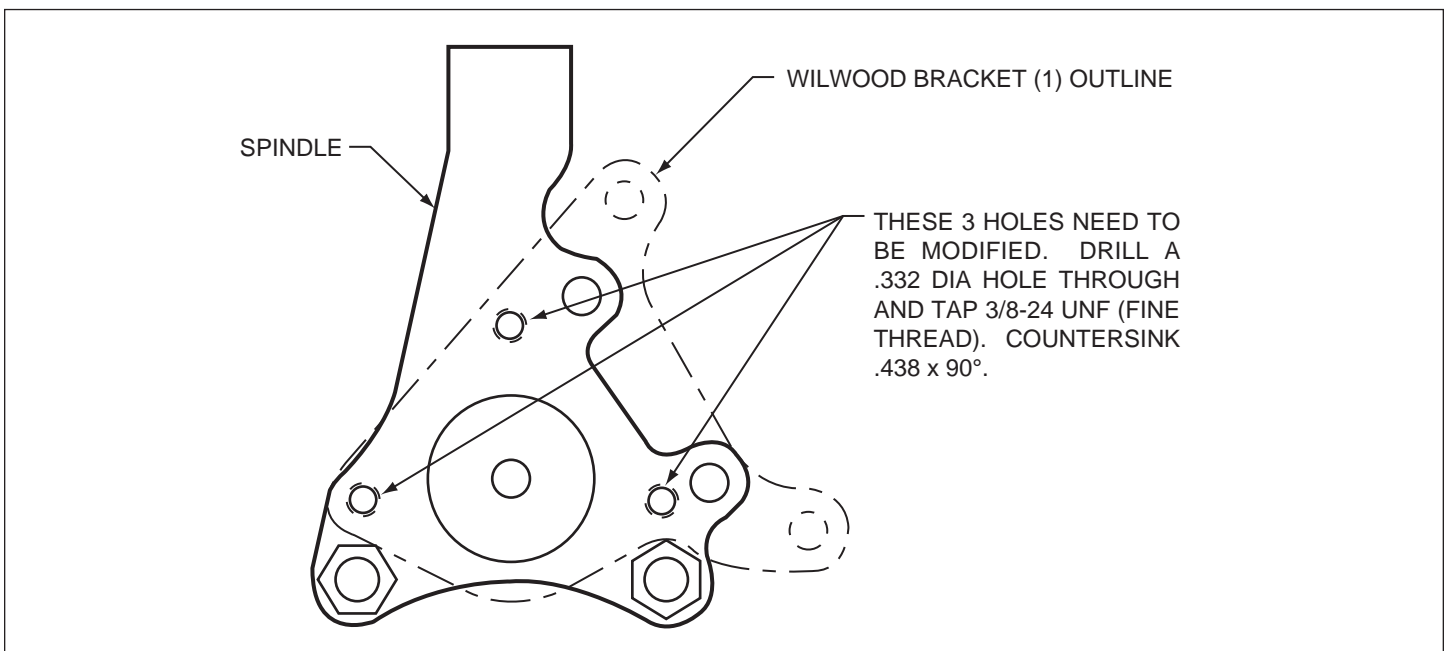

Figure 1. Steering Arm / Spindle Modifications

Figure 2. Typical Installation Configuration

Parts List

ITEM NO.	PART NO.	DESCRIPTION	QTY
1	249-3447/48	Brackets, Caliper (pair, one each, left and right)	1
2	230-3206	Bolt, 3/8-24 x 1.00 Long	6
3	230-0921	Stud, 1/2-20 x 3.00 Long, SHCS	10
4	270-8777	Hub Assembly	2
5	370-0884	Cone, Inner Bearing	2
6	380-3446	Seal, Grease	2
7	300-3307	Adapter, Rotor	2
8	160-3305	Rotor, .35" Thk x 10.75" Dia, 6 x 6.25" Bolt Circle	2
8A	160-3306	Rotor, Drilled	2
9	230-2043	Bolt, 5/16-18 x 0.75 Long	12
10	230-11239	Bolt, 3/8-16 x 1.00 Long, Torx Button Head	10
11	370-0877	Cone, Outer Bearing	2
12	240-2283	Washer, Spindle, 3/4	2
13	211-1674	O-ring	2
14	270-2158	Cap, Dust	2
15	120-6818	Caliper, Forged Dynalite	2
16	240-10190	Washer, .391 I.D. x .625 O.D. x .063 Thick	4
17	230-0228	Bolt, 3/8-24 x 1.25 Long, Hex Head	4
18	240-1159	Washer, Shim, .032 Thick	16
19	150-8850K	Pads, BP-10 Compound, Axle Set	1
20	180-0055S	Pin, Cotter	2

NOTES: Part Number 230-3829 Bolt Kit, adapter plate to hub, includes part number 230-11239

Part Number 230-3328 Bolt Kit, rotor to adapter plate, includes part number 230-2043

Part Number 230-0204 Bolt Kit, caliper to bracket, includes part numbers 230-0228, 240-10190 and 240-1159

Item 8A is an optional item and is included in the (D) drilled kits.

Assembly Instructions

Assembly Instructions (numbers in parenthesis refer to the diagram above, and the parts list on the preceding page): **CAUTION:** All mounting bolts must fully engage insert nuts. Be sure to check that all bolts are either flush or protruding through flanged side of each insert nut after shimming.

- Identify the left and right caliper mounting brackets (1). Both brackets will be offset to the rear of the vehicle with the threaded inserts and the beveled bolt holes facing the outside of the vehicle. Apply red *Loctite*® 271 to bolt threads (2) before assembly of the caliper bracket (1) to backing plate face of spindle. Insert the three mounting bolts (2) through the caliper mounting bracket (1). Position the caliper mounting bracket (1) onto the spindle, slipping each of the three mounting bolts (2) into the threaded spindle holes, evenly finger tighten. Torque the three bolts (2) to 30 ft-lb. **NOTE:** Be sure the heads of the caliper bracket (1) insert nuts are facing outward toward the wheel.

- Install five new wheel studs (3) into the hub (4). Torque to 77 ft-lb. **NOTE:** There are two five lug patterns in the hub (5 x 4.00 and 5 x 4.50). Make sure of the correct hole pattern for the correct wheel application before installing studs into hub.

- Pack the large inner bearing cone (5) with high temperature disc brake bearing grease (available from your local auto parts store) and install into the backside of the hub (4).

- Install the grease seal (6) by pressing into the backside of the hub (4).

- Attach rotor adapter (7) to rotor (8) using six bolts (9). Using an alternating sequence, apply red *Loctite*® 271 to the threads and torque bolts (9) to 25 ft-lb. For an added measure of security, the bolts may be safety wired using standard 0.032 inch diameter stainless steel safety wire as shown in Figure 4. Please refer to Wilwood's data sheet DS-386 (available at www.wilwood.com/Pdf/DataSheets/ds386.pdf) for complete safety wire installation instructions. **NOTE:** The flat side of the rotor (8) lugs face toward the rotor adapter (7) with the dished side of the rotor adapter (7) facing away from the rotor (8).

- Mount the adapter/rotor assembly (7/8) to the hub (4) using bolts (10) (finger tight), as shown in Figure 1. Using an alternating sequence, remove bolts one at a time, apply red *Loctite*® 271 to the threads, and torque to 55 ft-lb.

- Pack the small outer bearing cone (11) with high temperature disc brake bearing grease. Lightly coat the spindle bearing surfaces with bearing grease. Slide the hub/rotor assembly (4 and 8) with outer bearing cone (11) onto the spindle. Secure using spindle washer (12), existing adjusting nut and nut locking device.

- Bearing adjustment:

Tighten the wheel bearing nut to 60 in-lb while turning the hub/rotor assembly (4 and 8). Position the nut lock on the wheel bearing nut with one pair of slots in-line with (covering) the cotter pin hole. Back off the adjusting nut lock assembly one slot and install a new cotter pin. **The resulting adjustment should be zero (no pre-load) to 0.003 inch end play.**

- Install the dust cap (14) onto the hub (4). Friction created by the o-ring (13) on the dust cap (14) keeps it from unscrewing. The O.D. of the existing spindle washer may be larger than the I.D. of the dust cap (14) which may allow the washer to contact the dust cap (14). Use the spindle washer (12) supplied with the kit instead of the stock washer.

- NOTE:** Please reference the caution statement at the beginning of the assembly instructions. Mount the caliper (15) onto the caliper bracket (1) using two bolts (17), two washers (16) and two flat "shim" washers (18). Finger tighten. View the rotor (8) through the top of the caliper (15). The rotor (8) should be aligned in the center of the caliper (15). If not, loosen the two bolts (17) and adjust the caliper (15) by using 0.032 inch thick shim washers (18). The shim washers (18) should be placed between the caliper (15) and the caliper mounting bracket (1). Finger tighten and recheck alignment. Add as many shim washers (18) as necessary to achieve the correct alignment. **NOTE:** The end of the bolt must be flush with or slightly protruding from the head of the clinch nut. See Figure 5.

Figure 3. Wheel Clearance Diagram

Figure 4. Safety Wire Diagram

Assembly Instructions (Continued)

Place spare shims (18) between washer and caliper mounting ear to achieve the proper mounting fastener configuration. Always use the same amount of shims on both the top and bottom caliper mounting bolts (17). Loosen the two bolts (17) and apply red *Loctite*® 271 to the bolt threads (17) and torque to 40 ft-lb. Caliper mount bolts may be safety wired for additional security.

- Install the disc brake pads (19) into the caliper (15). Secure the disc brake pads to the caliper utilizing cotter pin (20).
- Temporarily install wheel and torque lug nuts to manufacturer's specification. Ensure that the wheel rotates freely without any interference. **NOTE:** *Wheel spacer (Wilwood P/N 300-11961) MUST be used if any wheel contact surfaces overhang the outside diameter of the hub face. See warning on page 2.*
- Repeat the above steps for the other wheel.
- **NOTE:** *OEM rubber brake hoses generally cannot be adapted to Wilwood calipers. The caliper inlet fitting is a 1/8-27 NPT. The preferred method is to use steel adapter fittings at the caliper, either straight, 45 or 90 degree and enough steel braided line to allow for full suspension travel and turning radius, lock to lock. Carefully route lines to prevent contact with moving suspension, brake or wheel components. Wilwood hose kits are designed for use in many different vehicle applications and it is the installer's responsibility to properly route and ensure adequate clearance and retention for brake hose components.*

- Specified brake hose kits may not work with all Years, Makes and Models of vehicle that this brake kit is applicable to, due to possible OEM manufacturing changes during a production vehicle's life. It is the installer's responsibility to ensure that all fittings and hoses are the correct size and length, to ensure proper sealing and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor or wheel.
- In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. Test vehicle brake system per the 'minimum test' procedure stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in a interval relative to the usage of vehicle.

- Bleed the brake system. Reference the general information and recommendations on page 7 for proper bleeding instructions.

- Install the wheel and torque to manufacturer's specifications. **NOTE:** *Wheel spacer (Wilwood P/N 300-11961) MUST be used if any wheel contact surfaces overhang the outside diameter of the hub face. See warning on page 2.*

Clinch Nut Engagement Diagram

Balancing the Brake Bias on 4 Wheel Disc Vehicles

•OE Style or Single Mount Race Pedal with Tandem Outlet Master Cylinder:

Front to rear caliper piston sizes, rotor diameters, and pad compounds must be initially configured to provide the correct range of vehicle bias when using a single bore / tandem outlet master cylinder. If excessive rear brake bias is experienced, an inline adjustable proportioning valve can be used to decrease the rear line pressure to help bring the vehicle into balance. If excessive front brake bias is experienced, first consideration should be given to increasing the rear brake bias to bring the vehicle into overall balance.

•Race Pedal with Dual Master Cylinders and Balance Bar:

Master cylinders must be sized to match the calipers and allow the pedal balance bar to operate near the center of its travel. If it is not possible to fine tune the bias within the adjustable range of the balance bar, then consideration must be given to changing a master cylinder bore size or some other aspect of the brake system to bring the car into balance. Larger bore master cylinders will generate less pressure while decreasing pedal travel. Smaller bores master cylinders will generate higher line pressures with an increase in pedal travel.

Additional Information and Recommendations

•Fill and bleed the new system with Wilwood Hi-Temp^o 570 grade fluid or higher. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination.

NOTE: *Silicone DOT 5 brake fluid is **NOT** recommended for racing or performance driving.*

•To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder.

NOTE: *When using a new master cylinder, it is important to bench bleed the master cylinder first.*

•If the master cylinder is mounted lower than the disc brake calipers, some fluid flowback to the master cylinder reservoir may occur, creating a vacuum effect that retracts the caliper pistons into the housing. This will cause the pedal to go to the floor on the first stroke until it has “pumped up” and moved all the pistons out against the pad again. A Wilwood in-line two pound residual pressure valve, installed near the master cylinder will stop the fluid flowback and keep the pedal firm and responsive.

•Test the brake pedal. It should be firm, not spongy and stop at least 1 inch from the floor under heavy load.

If the brake pedal is spongy, bleed the system again.

If the brake pedal is initially firm, but then sinks to the floor, check the system for fluid leaks. Correct the leaks (if applicable) and then bleed the system again.

If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, a master cylinder with increased capacity (larger bore diameter) will be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities.

•**NOTE:** *With the installation of after market disc brakes, the wheel track may change depending on the application. Check your wheel offset before final assembly.*

•On some models of disc brake spindles there are “ears” where the OEM calipers were mounted and these “ears” interfere with the assembly of the Wilwood disc brake kit. If it becomes necessary to remove these “ears”, remove as little as possible being careful not to cut away any of the mounting holes that may be required to bolt on the caliper mounting bracket.

•If after following the instructions, you still have difficulty in assembling or bleeding your Wilwood disc brakes, consult your local chassis builder, or retailer where the kit was purchased for further assistance.

Brake Testing

WARNING • DO NOT DRIVE ON UNTESTED BRAKES BRAKES MUST BE TESTED AFTER INSTALLATION OR MAINTENANCE MINIMUM TEST PROCEDURE

- Make sure pedal is firm: Hold firm pressure on pedal for several minutes, it should remain in position without sinking. If pedal sinks toward floor, check system for fluid leaks. DO NOT drive vehicle if pedal does not stay firm or can be pushed to the floor with normal pressure.
- At very low speed (2-5 mph) apply brakes hard several times while turning steering from full left to full right, repeat several times. Remove the wheels and check that components are not touching, rubbing, or leaking.
- Carefully examine all brake components, brake lines, and fittings for leaks and interference.
- Make sure there is no interference with wheels or suspension components.
- Drive vehicle at low speed (15-20 mph) making moderate and hard stops. Brakes should feel normal and positive. Again check for leaks and interference.
- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.
- Always wear seat belts and make use of all safety equipment.

Pad and Rotor Bedding

BEDDING STEPS FOR NEW PADS AND ROTORS – ALL COMPOUNDS

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.
- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.
- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.
- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.
- Drive at a moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

COMPETITION VEHICLES

- If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.
- Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.

Pad and Rotor Bedding (Continued)

POST-BEDDING INSPECTION – ALL VEHICLES

- After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn't blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP

- Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS

- Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and **Spec 37** GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE:

NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
